Future Potential in IT
This afternoon!
3-6PM
Guggenheim 220
Free pizza and prizes
Alumni from
Business, CSE, Info, TC
Pre-register:
http://depts.washington.edu/tc/fpit.html

• Repeat: CLASS RULES
• Lecture ends at 1:20pm!
• I expect quiet until class is over as a
courtesy to me and a
courtesy to your fellow students
• This means that no one
• picks up their backpack or puts their notebook
away until 1:20pm
• leaves until after the lights are turned back up at
1:20pm

Using Fluency 2nd edition?
• Comparison of 2nd and 3rd editions
online at the course Web site
• I'll notify you when something is really
different
• Copies of this quarter's textbooks
• Available at Odegaard Undergraduate
Library's Course Reserves
• 24-hour checkout

Pop Quiz this week in one of your lab
sessions
• Review
• questions at end of chapter, answers at
back of book
• Content in Chapters 4 and 5
• Ten true/false or multiple-choice questions
• One extra credit

Topics can range from science fiction to the
National Inquirer!
• Another sphinx found amidst Lunar ruins of old
civilization
• New human gene found
• Eiffel Tower moved to Seattle
• Dolphin dictionary developed and tested: first
address by the Queen Dolphin
• 12-year-old quarterback leads Huskies to third
national title!

Label the site as a hoax or bogus
• Logo
• Disclaimer
Project 1

- Include copyright information for all photos that are used
  - See instructions for more details

Announcements

- New deadlines for Project 1
  - 1A: January 30, before 11pm
  - 1B: February 6, before 11pm

Debugging & Troubleshooting

“To err is human, but it takes a computer to really foul things up”

© 2008 Lawrence Snyder

Precision: The High Standards of IT

- Precision in Everyday Life
  - Many people say “oh” rather than zero when giving a phone number
  - The listener makes the mental conversion because he knows phone numbers are numeric
  - Computer does not know that unless it has been programmed to know it

Exactly How Accurate Is “Precise?”

- Modem or database software can be programmed to make “oh” to zero corrections automatically because all digits will always be numbers
- In e-mail programs, both letters and numbers are allowed, so the computer can’t be programmed to auto-correct. Users have to be careful

Lexical Structures

- Field Inputs: Information entered into boxes/forms on screen
  - Governed by lexical structures (rules about the legal form, or syntax, for input fields)
    - May limit symbols that can appear in specific positions, length of entry, etc.
    - May also be loose, allowing any sequence of symbols of any length
Debugging: What's the Problem?

- Debugging: The method of figuring out why a process or system doesn't work properly
  - Usually learned from experience
- Debugging in Everyday Life: People troubleshoot problems such as why their cars don't start
  - Usually involve working system with broken or worn-out part
- Debugging in Information Technology:
  - Working system might have wrong data or wrong configuration information or
  - There might be a logical design error
  - We will always begin by assuming a correct, working system

Lab 4

- Debugging HTML
  - http://courses.washington.edu/benefit/FIT100/Lessons/Lesson3/graphics/htmldesign/bug.swf

Whose Problem Is It?

- When we debug an information system, we are always part of the problem
  - We give the commands and the input
  - Operator or pilot error
  - Only other possible cause is broken system
- People don't knowingly make errors
  - We may think we did everything right because we misunderstand the system

Using the Computer to Debug

- A computer can't debug itself
- We can't debug it directly, either
- Error is internal to the computer
  - To get information about the error, we have to ask the computer what data it stored, etc.
- With faulty software we cannot fix, try to bypass error with alternative approach (workaround)

Dialog About Debugging

- Debugging is solving a mystery
  - What's the problem vs. who's the problem?
- Ask purposeful questions like:
  - Do I need more clues?
  - Are my clues reliable?
  - What is a theory to explain the problem?
- Better than aimlessly "trying stuff"
Debugging (cont'd)

• Steps to follow:
  1. Check that the error is reproducible
  2. Make sure you know what the problem is
     • If no mailing labels come out of printer, problem may be with printer or with program sending labels to printer or file containing addresses
  3. Check all the "obvious" sources of error
  4. Isolate the problem
     • Divide operation into those parts that are working and those that are not working
     • Think objectively—ask yourself if you’ve made a wrong assumption, etc.

Debugging Recap

• Make sure you can reproduce the error
• Determine exactly what the problem is
• Eliminate "obvious" causes (is it plugged in?)
• Divide the process, separating out the parts that work from the part that doesn’t (isolate the problem)
• When you reach a dead end, reassess your information; then step through the process again
• As you work through, make predictions about what should happen and verify that they are fulfilled

Butterflies And Bugs: A Case Study

• Imagine we’ve developed a simple HTML page
• Following is our goal page:

Our Goal Page:

Endangered Butterflies

Nabokov's Blues Threatened

A species of small butterflies, all recorded a long time ago, were collected in the coastal regions of Europe and Asia. These butterflies have been threatened by the loss of their natural habitat due to deforestation and pollution.

The butterfly, Canisianus, named after Nabokov, is among the threatened species. It requires a specific set of conditions to thrive, including the presence of certain plants and the absence of predators.

<table>
<thead>
<tr>
<th>Butterfly</th>
<th>Status</th>
<th>Threat</th>
</tr>
</thead>
<tbody>
<tr>
<td>Canisianus</td>
<td>Endangered</td>
<td>Loss of habitat</td>
</tr>
</tbody>
</table>

</table>

Figure 1.2: The Butterflies page as displayed by the Babelfish browser

Figure 1.3: The butterfuly page displayed by the Babelfish browser
Butterflies and Bugs (cont'd)

- Displaying the page in Safari and Mozilla also produces errors
  - Test in multiple browsers!
- We can study the HTML very closely and "brain out" where the error is
- We will use the debugging strategy

Butterflies and Bugs (cont'd)

- First, be sure we can re-create the error
  - Reload the page
  - In this case, the results are the same
- Next, determine the problem exactly
  - Look at the displayed page and determine where the errors occur
  - Since there are multiple errors on different parts of the page, assume they are caused by different mistakes in the HTML
  - Try to fix first/top error on page first; save and refresh browser

The HTML for Our Page

- Next, eliminate the obvious
  - In HTML, most common error is forgetting to close a tag
    - For example: `<b>` with no closing `</b>` tag
  - Make sure all quotes match (open and close)
    - In this case, the word "Blues" appears in red on the page. Why?
      - `<caption><b><font color=blue">Blues</font>`
    - Missing opening quotation mark around the attribute value "blue"
    - Why is the "More here" link not highlighted?
      - Space missing between `<a` and `href`
Butterflies and Bugs (cont’d)

Butterflies and Bugs (cont’d)

• Divide up the process
  • Separate the parts of the system that work from the parts that do not
    • First row of the table
    • Browsers and debugging systems for HTML can give us a color-coded version of the HTML, showing how it's being interpreted (for example, Notepad++)
      - View (page) source
    • We see the entire heading line is colored blue as if it's an attribute
    • The problem turns out to be a fancy quote that the browser cannot interpret

Butterflies and Bugs (cont’d)

• First row of the table
• Browsers and debugging systems for HTML can give us a color-coded version of the HTML, showing how it's being interpreted (for example, Notepad++)
  - View (page) source
• We see the entire heading line is colored blue as if it's an attribute
• The problem turns out to be a fancy quote that the browser cannot interpret

Butterflies and Bugs (cont’d)

• Reassess
  • The pictures are still not displaying
  • We find that the image tags are well structured and the browser is interpreting them correctly
  • What is the problem?
    • To check that the images are ok, display in another document
    • To check that the JPEG specification is ok, put another image file in the document
    • Check the exact file name for the image, including capitalization
      - In this case, we find the filename extension is .jpeg, not .jpg as we have been using

Butterflies and Bugs (cont’d)

• Reassess
  • The pictures are still not displaying
  • We find that the image tags are well structured and the browser is interpreting them correctly
  • What is the problem?
    • To check that the images are ok, display in another document
    • To check that the JPEG specification is ok, put another image file in the document
    • Check the exact file name for the image, including capitalization
      - In this case, we find the filename extension is .jpeg, not .jpg as we have been using

Butterflies and Bugs (cont’d)

• Unnecessary changes:
  • During the debugging process, we made some unnecessary changes due to wrong conjectures about the error
  • Making unnecessary changes is typical in debugging
    • Sometimes we even make the situation worse by introducing new errors

Butterflies and Bugs (cont’d)

• Unnecessary changes:
  • During the debugging process, we made some unnecessary changes due to wrong conjectures about the error
  • Making unnecessary changes is typical in debugging
    • Sometimes we even make the situation worse by introducing new errors

Butterflies and Bugs (cont’d)

• Hiding other errors:
  • At first we thought we had three errors—bad caption, missing link, busted table
  • Because there were two things wrong with the table (messed up heading line and wrong file names specified) there were actually four errors
  • Because it is common for one error to hide another, always suspect there is more than one error
Butterflies and Bugs (cont'd)

• Viewing the source:
  • Most effective technique in our debugging was the View Source feature
  • In general, one of the most powerful debugging techniques is to find ways for the computer to tell us the meaning of the information it stores or the commands it executes

• Little errors, big problems:
  • The errors in the HTML code were tiny, but they had serious effects
  • We must be extremely precise

No Printer Output: A Classic Scenario

• Most systems we use, we don’t create
• The software is very complicated. How do we troubleshoot a system we don’t understand?
• Generally, software has been extensively tested before we come in contact with it
  • Standard operations are likely to be bug-free
• To illustrate debugging a system without understanding it, consider a common problem: You try to print a document and nothing comes out of the printer

Applying the Debugging Strategy

• Apply the debugging strategy:
  • Reproduce the error, understand the problem, check the obvious causes
  • Check the printer’s control panel, the paper, the cartridges, cable connection, file to be printed, installation of printer driver, whether others can print (if it’s a shared printer) and whether you can print a different document
  • Simple, quick checks
  • If this does not solve the problem, press on

Pressing On

• Try to isolate the problem:
  • Configuration is correct because you’ve printed before
  • Try printing a simple document
  • Same problem
  • Think through the probable process:
    • If the computer couldn’t send the data to the printer, wouldn’t it give a message to plug in the printer?
    • Look around for the stranded files
      – In the printing monitor’s files, you find a list of files you’ve tried to print recently
      – Start > Printers and Faxes

The Print Queue

• You’ve found the print queue
• Computer’s settings may tell it to “queue” converted files rather than printing them immediately
  • Pause Printing
  • You may never know how this occurred, but you can still fix it by re-configuring the driver
  • Unclick Pause Printing or click Resume Printing
Endangered Butterflies

Nabokov's Blue Threatened

Platytrygon mylitta, the famous Russian author's favorite butterfly species, has been named in his honor. It is threatened with extinction.

This butterfly, Platytrygon's Blue, is a rare species, and it is facing сritical threats.

<table>
