There's a strategy to thinking up algorithms

Algorithmic Design

Lawrence Snyder
University of Washington, Seattle
Announcements

- Pair Programming for the next week
- Monday AI lecture
- Tuesday, Pizza Party and Watson Plays Jeopardy
Algorithms

- Def. An algorithm is a precise, systematic process for an agent to produce a specified result
- Five properties characterize algorithms

  - **Input specified** – tell form and amount of input required
  - **Output specified** – tell form and amount of output produced
  - **Definiteness** – say explicitly what to do & in what order
  - **Effectiveness** – operations within agent’s abilities
  - **Finiteness** – will stop and give an answer or say “none”

- Programs are algorithms
Algorithms At Many Levels of Detail

- The binary code computers execute are algorithms
- Software developers create algorithms all the time
  - Using languages like C, C++, Java, JavaScript, etc.
  - A compiler (it’s a translator) converts to binary code
- These cases specify computation in complete detail because computers are clueless
- But at other levels the agent is a person ...
Google Query Algorithm

- In their paper Larry Page and Sergey Brin gave their algorithm for processing a Google query

1. Parse the query.
2. Convert words into wordIDs.
3. Seek to the start of the doclist in the short barrel for every word.
4. Scan through the doclists until there is a document that matches all the search terms.
5. Compute the rank of that document for the query.
6. If we are in the short barrels and at the end of any doclist, seek to the start of the doclist in the full barrel for every word and go to step 4.
7. If we are not at the end of any doclist go to step 4.
8. Sort the documents that have matched by rank and return the top k.

Figure 4. Google Query Evaluation

- This algorithm is understandable to readers
There are always different algorithms to pick

Consider sorting ...

- We’ve discussed
- Exchange Sort for
  - walrus
  - seal
  - whale
  - gull
  - clam
- Compare with every value following
Now Consider Bubble Sort...

- Bubble Sort for
  - walrus
  - seal
  - whale
  - gull
  - clam

- Compare in pairs, letting larger values bubble up

```plaintext
walrus  seal  whale  gull  clam
se  wa  wh  g  c
se  wa  wh  g  c
se  wa  g  wh  c
se  wa  g  c  wh
se  wa  g  c  wh
se  g  wa  c  wh
se  g  c  wa  wh
se  c  wa  wh
se  c  wa  wh
```
The two algorithms take the same amount of time, but they are different as we see from the patterns of their comparisons.
Key Question for Today & Always

- How do we know that the algorithms work?
  - Developing algorithms is not just thinking them up
  - It is also reasoning through why they work ... you need to know why explicitly enough to tell someone else

- Let’s see how to do that
Why Does Exchange Sort Work?

- Why do you think it sorts?

```
wa se wh g  c
se wa wh g  c
se wa wh g  c
g  wa wh se  c
c  wa wh se  g
c  wa wh se  g
c  se  wh wa g
c  se  wh wa g
c  g  wh wa se
c  g  wh wa se
c  g  se  wh wa
c  g  se  wa wh
```
Why Does Exchange Sort Work?

- Why do you think it sorts?
  - There are several passes through the data with leading item fixed (marked with lines)

- Notice this property: After the pass, the leading item must be the smallest of all processed on the pass

wa se wh g  c
se wa wh g  c
se wa wh g  c
g wa wh se c
c wa wh se g
c wa wh se g
c se wh wa g
c g wh wa se
c g wa wh se
c g se wh wa
c g se wa wh
Why Does Bubble Sort Work?

- Why do you think it sorts?

```plaintext
wa se wh g c
se wa wh g c
se wa wh g c
se wa g wh c
se wa g c wh
se wa g c wh
se g wa c wh
se g c wa wh
g se c wa wh
g c se wa wh
c g se wa wh
```
Why Does Bubble Sort Work?

- Why do you think it sorts?
  - There are several passes through the data comparing pairs of data (marked w/ lines)

- Notice this property: After the pass, pair compares will locate the next largest item and bubble it into position
It is not sufficient to think up a clever algorithm ... you need to know why it works.

It’s usually not tough, because the logic of your method typically translates into an explanation of why it works.

But you must think about it!!
