CSE 140 wrapup

Michael Ernst
CSE 140
University of Washington
Progress in 10 weeks

10 weeks ago: you knew no programming

Goals:

– Computational problem-solving
– Python programming language
– Experience with real datasets
– Fun of extracting understanding and insight from data, and of mastery over the computer
– Ability to go on to more advanced computing classes

Today: you can write a useful program to solve a real problem

– You can even pose the problem yourself
Example from lecture 0:
Assessing treatment efficacy

number of follow ups within 16 weeks after treatment enrollment.

Question: Does the distance between the patient’s home and clinic influence the number of follow ups, and therefore treatment efficacy?
Python program to assess treatment efficacy

# This program reads an Excel spreadsheet whose penultimate and antepenultimate columns are zip codes.
# It adds a new last column for the distance between those zip codes, and outputs in CSV (comma-separated values) format.
# Call the program with two numeric values: the first and last row to include.
# The output contains the column headers and those rows.

# Libraries to use
import random
import sys
import xlrd  # library for working with Excel spreadsheets
import time
from gdapi import GoogleDirections

# No key needed if few queries
gd = GoogleDirections('dummy-Google-key')

wb = xlrd.open_workbook('mhip_zip_eScience_121611a.xls')
sheet = wb.sheet_by_index(0)

# User input: first row to process, first row not to process
first_row = max(int(sys.argv[1]), 2)
row_limit = min(int(sys.argv[2])+1, sheet.nrows)

def comma_separated(lst):
    return ','.join([str(s) for s in lst])

headers = sheet.row_values(0) + ['distance']
print comma_separated(headers)

for rownum in range(first_row, row_limit):
    row = sheet.row_values(rownum)
    (zip1, zip2) = row[-3:-1]

    if zip1 and zip2:
        # Clean the data
        zip1 = str(int(zip1))
        zip2 = str(int(zip2))
        row[-3:-1] = [zip1, zip2]

        # Compute the distance via Google Maps
        try:
            distance = gd.query(zip1, zip2).distance
        except:
            print >> sys.stderr, "Error computing distance:", zip1, zip2
distance = ""

        # Print the row with the distance
        print comma_separated(row + [distance])

        # Avoid too many Google queries in rapid succession
        time.sleep(random.random()+0.5)

23 lines of executable code!
A huge **thanks** to the rest of the staff

Why do you care about processing data?

• The world is awash in data
• Processing and analyzing it is the difference between success and failure
  – for a team or for an individual
• Manipulating and understanding data is essential to:
  – Astronomers
  – Biologists
  – Chemists
  – Economists
  – Engineers
  – Entrepreneurs
  – Linguists
  – Political scientists
  – Zoologists
  – ... and many more!
## Why the Python language?

Comparison of Python with Java

• Python is better for learning programming
• Python is better for small programs
• Java is better for large programs

Main difference: dynamic vs. static typing
• Dynamic typing: put anything in any variable
• Static typing:
  – Source code states the type of the variable
  – Cannot run code if any assignment might violate the type
Python concepts

- Assignments
- Variables
- Types
- Programs & algorithms
- Control flow: loops (for), conditionals (if)
- File I/O
- Python execution model
  - How Python evaluates expressions, statements, and programs
Data structures: managing data

- List
- Set
- Dictionary
- Tuple
- Graph

- List slicing (sublist)
- List comprehension: shorthand for a loop

- Mutable and immutable data structures
  - Immutable: easier to reason about, less efficient

- Distinction between identity and value
• **Procedural abstraction**
  – avoid duplicated code
  – the implementation does not matter to the client
• **Using functions**
• **Defining functions**
• **A function is an ordinary value**
  – assign to variables
  – in a call, use an expression as the function: `myfns[i](arg)`
• **Method syntax:** put first argument before a period (.)
  – `arg1.methodname(arg2, arg3)`
  – used for “objects”
  – (period also means “look up variable in a namespace”)

\[ f(x) = x^2 \]
Data abstraction

Dual to procedural abstraction (functions)
A module is: operations
An object is: data + operations
   Operations: create, query, modify
   Clients use the operations, never directly access data
The representation of the data does not matter
Programmer defines a class.
Each instance of a class is an object.
Testing and debugging

Write enough tests:
  – Cover every branch of each boolean expression
    • especially when used in a conditional expression (if statement)
  – Cover special cases:
    • numbers: zero, positive, negative, int vs. float
    • data structures: empty, size 1, larger

Assertions are useful beyond tests

Debugging: after you observe a failure
  – Divide and conquer
    • In time, in data, in program text, in development history
    • this is also a key program design concept
  – The scientific method
    • state a hypothesis; design an experiment; understand results

Think first
  – Be systematic: record everything; have a reason for each action
Data analysis

Statistics
  – Run many simulations
  – How uncommon is what you actually saw?

Graphing/plotting results
Program design

How to write a function:
1. Name, arguments, and documentation string
2. Tests
3. Body/implementation

How to write a program:
1. Decompose into parts (functions, modules)
   • Each part should be a logical unit, not too large or small
2. Write each part
   • Define the problem
   • Choose an algorithm
   • In English first; test it via manual simulation
   • Translate into code

When necessary, use wishful thinking
  • Assume a function exists, then write it later
  • Can test even before you write it, via a stub
Recursion

• Base case: does all the work for a small problem
• Inductive case:
  – passes the buck for most of a large problem
  – does a small amount of work (or none) to the subanswer
  – returns whole result
Speed of algorithms

Affected primarily by the number of times you iterate over data

“Constant factors” don’t matter (looping 2 times or 3 times)

Nested looping matters a lot
There is more to learn

• Data analysis, data science, and data visualization
• Scaling up:
  – Larger and more complex programs
  – “Big data”: out-of-memory data, parallel programming, ...
• Ensuring correctness
  – Principled, systematic design, testing, and programming
  – Coding style
• Managing complexity
  – Programming tools: testing, version control, debugging, deployment
  – GUIs, user interaction
  – Data structures and algorithms
  – Working in a team
What you have learned in CSE 140

Compare your skills today to 10 weeks ago

Theory: abstraction, specification, design
Practice: implementation, testing

Bottom line: The assignments would be easy for you today
This is a measure of how much you have learned

There is no such thing as a “born” programmer!

Your next project can be more ambitious

Genius is 1% inspiration and 99% perspiration.
Thomas A. Edison
What you will learn later

Your next project can be much more ambitious

Know your limits

   Be humble (reality helps you with this)

You will continue to learn

   Building interesting systems is never easy

      Like any worthwhile endeavor

Practice is a good teacher

   Requires thoughtful introspection

Don’t learn only by trial and error!

Get lots of practice and feedback
What comes next?

Classes

– Java: CSE 142 (you might skip), CSE 143, CSE 143X
– HDCE 310: Python for Internet mashups
– MATLAB, other programming languages
– Self-study: books & websites

Data analysis: classes, research, jobs

– In programming and software engineering
– In any topic that involves software

Having an impact on the world

– Jobs (and job interviews)
– Larger programming projects

The purpose of computing is insight, not numbers.
Richard W. Hamming
*Numerical Methods for Scientists and Engineers*
Go forth and conquer

System building and scientific discovery are fun!
   It’s even more fun when your system works
Pay attention to what matters
   Use the techniques and tools of CSE 140 effectively
