

# Building Java Programs

Chapter 7

Lecture 7-3: Arrays for Tallying; Text Processing

**reading: 4.3, 7.6**

THE #1 PROGRAMMER EXCUSE  
FOR LEGITIMATELY SLACKING OFF:  
"MY CODE'S COMPILING."

HEY! GET BACK  
TO WORK!

COMPILING!

OH. CARRY ON.

# Value/Reference Semantics

- Variables of primitive types store values directly:

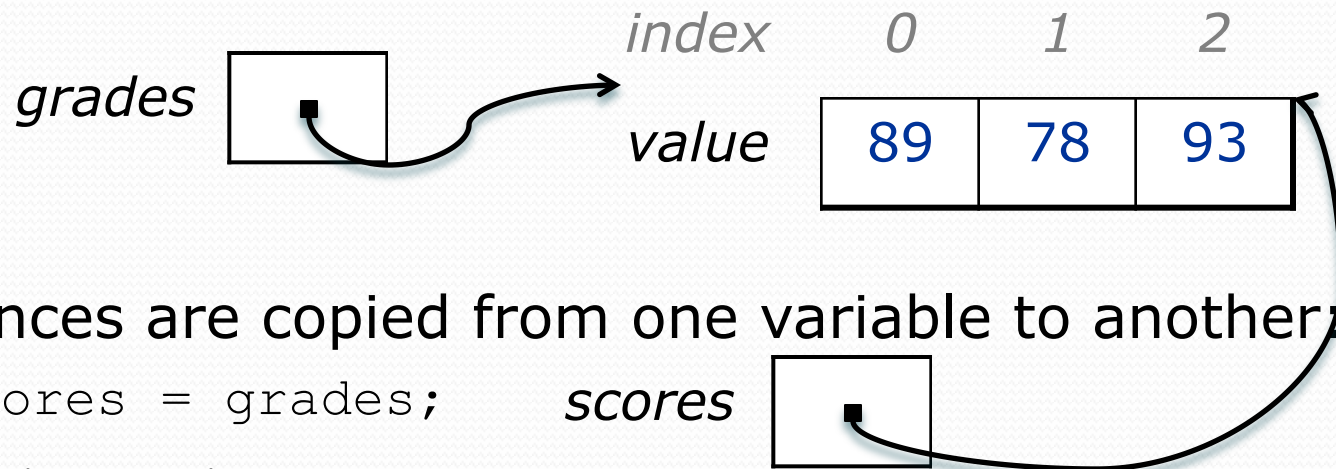

*age* 20

*cats* 3

- Values are copied from one variable to another:

`cats = age;`     *age* 20     *cats* 20

- Variables of object types store references to memory:

- References are copied from one variable to another:

`scores = grades;`     *scores* □

# Text processing

**reading: 7.2, 4.3**

# String traversals

- The chars in a String can be accessed using the `charAt` method.
  - accepts an `int` index parameter and returns the `char` at that index

```
String food = "cookie";  
char firstLetter = food.charAt(0);    // 'c'  
System.out.println(firstLetter + " is for " + food);
```

- You can use a `for` loop to print or examine each character.

```
String major = "CSE";  
for (int i = 0; i < major.length(); i++) {    // output:  
    char c = major.charAt(i);              // C  
    System.out.println(c);                  // S  
}
```

# A multi-counter problem

- Problem: Write a method `mostFrequentDigit` that returns the digit value that occurs most frequently in a number.
  - Example: The number 669260267 contains:  
one 0, two 2s, four 6es, one 7, and one 9.  
`mostFrequentDigit(669260267)` returns 6.
  - If there is a tie, return the digit with the lower value.  
`mostFrequentDigit(57135203)` returns 3.

# A multi-counter problem

- We could declare 10 counter variables ...

```
int counter0, counter1, counter2, counter3, counter4,  
    counter5, counter6, counter7, counter8, counter9;
```

- But a better solution is to use an array of size 10.
  - The element at index  $i$  will store the counter for digit value  $i$ .
  - Example for 669260267:

<i>index</i>	0	1	2	3	4	5	6	7	8	9
<i>value</i>	1	0	2	0	0	0	4	1	0	0

- How do we build such an array? And how does it help?

# Creating an array of tallies

```
// assume n = 669260267
int[] counts = new int[10];
while (n > 0) {
    // pluck off a digit and add to proper counter
    int digit = n % 10;
    counts[digit]++;
    n = n / 10;
}
```

*index*    0    1    2    3    4    5    6    7    8    9

<i>value</i>	1	0	2	0	0	0	4	1	0	0
--------------	---	---	---	---	---	---	---	---	---	---

# Tally solution

```
// Returns the digit value that occurs most frequently in n.  
// Breaks ties by choosing the smaller value.  
public static int mostFrequentDigit(int n) {  
    int[] counts = new int[10];  
    while (n > 0) {  
        int digit = n % 10; // pluck off a digit and tally it  
        counts[digit]++;  
        n = n / 10;  
    }  
  
    // find the most frequently occurring digit  
    int bestIndex = 0;  
    for (int i = 1; i < counts.length; i++) {  
        if (counts[i] > counts[bestIndex]) {  
            bestIndex = i;  
        }  
    }  
  
    return bestIndex;  
}
```

# Section attendance question

- Read a file of section attendance (*see next slide*):

```
yynyyynayayynyyyayanyyyyaynayyayyanayyyyanyayna  
ayyanyyyyayanaayyanayyyananayayaynyayayynynya  
yyayaynyyayyanynnyyyyayyanayaynannnyyayyayayny
```

- And produce the following output:

```
Section 1  
Student points: [20, 16, 17, 14, 11]  
Student grades: [100.0, 80.0, 85.0, 70.0, 55.0]
```

```
Section 2  
Student points: [16, 19, 14, 14, 8]  
Student grades: [80.0, 95.0, 70.0, 70.0, 40.0]
```

```
Section 3  
Student points: [16, 15, 16, 18, 14]  
Student grades: [80.0, 75.0, 80.0, 90.0, 70.0]
```

- Students earn 3 points for each section attended up to 20.

# Section input file

<b>student</b>	1234512345123451234512345123451234512345123451234512345
<b>week</b>	1 2 3 4 5 6 7 8 9
<b>section 1</b>	yynyyynayayynyyyayanyyyyaynayyayyyanayyyyanayayna
<b>section 2</b>	ayyanyyyyayanaayyanayyyananayayaynyayayynynya
<b>section 3</b>	yyayaynyyyayyanynnyyyayyanayaynannnyyayyyayayny

- Each line represents a section.
- A line consists of 9 weeks' worth of data.
  - Each week has 5 characters because there are 5 students.
- Within each week, each character represents one student.
  - a means the student was absent (+0 points)
  - n means they attended but didn't do the problems (+1 points)
  - y means they attended and did the problems (+3 points)

# Section attendance answer

```
import java.io.*;
import java.util.*;

public class Sections {
    public static void main(String[] args) throws FileNotFoundException {
        Scanner input = new Scanner(new File("sections.txt"));
        int section = 1;
        while (input.hasNextLine()) {
            String line = input.nextLine();           // process one section
            int[] points = new int[5];
            for (int i = 0; i < line.length(); i++) {
                int student = i % 5;
                int earned = 0;
                if (line.charAt(i) == 'y') {         // c == 'y' or 'n' or 'a'
                    earned = 3;
                } else if (line.charAt(i) == 'n') {
                    earned = 1;
                }
                points[student] = Math.min(20, points[student] + earned);
            }

            double[] grades = new double[5];
            for (int i = 0; i < points.length; i++) {
                grades[i] = 100.0 * points[i] / 20.0;
            }

            System.out.println("Section " + section);
            System.out.println("Student points: " + Arrays.toString(points));
            System.out.println("Student grades: " + Arrays.toString(grades));
            System.out.println();
            section++;
        }
    }
}
```

# Data transformations

- In many problems we transform data between forms.
  - Example: digits  $\rightarrow$  count of each digit  $\rightarrow$  most frequent digit
  - Often each transformation is computed/stored as an array.
  - For structure, a transformation is often put in its own method.
- Sometimes we map between data and array indexes.
  - by position (store the  $i^{\text{th}}$  value we read at index  $i$ )
  - tally (if input value is  $i$ , store it at array index  $i$ )
  - explicit mapping (count 'J' at index 0, count 'X' at index 1)
- *Exercise:* Modify our Sections program to use static methods that use arrays as parameters and returns.

# Array param/return answer

```
// This program reads a file representing which students attended
// which discussion sections and produces output of the students'
// section attendance and scores.

import java.io.*;
import java.util.*;

public class Sections2 {
    public static void main(String[] args) throws FileNotFoundException {
        Scanner input = new Scanner(new File("sections.txt"));
        int section = 1;
        while (input.hasNextLine()) {
            // process one section
            String line = input.nextLine();
            int[] points = countPoints(line);
            double[] grades = computeGrades(points);
            results(section, points, grades);
            section++;
        }
    }

    // Produces all output about a particular section.
    public static void results(int section, int[] points, double[] grades) {
        System.out.println("Section " + section);
        System.out.println("Student scores: " + Arrays.toString(points));
        System.out.println("Student grades: " + Arrays.toString(grades));
        System.out.println();
    }

    ...
}
```

# Array param/return answer

...

**// Computes the points earned for each student for a particular section.**

```
public static int[] countPoints(String line) {
    int[] points = new int[5];
    for (int i = 0; i < line.length(); i++) {
        int student = i % 5;
        int earned = 0;
        if (line.charAt(i) == 'y') {           // c == 'y' or c == 'n'
            earned = 3;
        } else if (line.charAt(i) == 'n') {
            earned = 2;
        }
        points[student] = Math.min(20, points[student] + earned);
    }
    return points;
}
```

**// Computes the percentage for each student for a particular section.**

```
public static double[] computeGrades(int[] points) {
    double[] grades = new double[5];
    for (int i = 0; i < points.length; i++) {
        grades[i] = 100.0 * points[i] / 20.0;
    }
    return grades;
}
```

# File output

**reading: 6.4 - 6.5**

# Output to files

- **PrintStream:** An object in the `java.io` package that lets you print output to a destination such as a file.
  - Any methods you have used on `System.out` (such as `print`, `println`) will work on a `PrintStream`.

- **Syntax:**

```
PrintStream name = new PrintStream(new File("file name"));
```

## Example:

```
PrintStream output = new PrintStream(new File("out.txt"));  
output.println("Hello, file!");  
output.println("This is a second line of output.");
```

# Details about `PrintStream`

```
PrintStream name = new PrintStream(new File("file name"));
```

- If the given file does not exist, it is created.
- If the given file already exists, it is overwritten.
- The output you print appears in a file, not on the console. You will have to open the file with an editor to see it.
- Do not open the same file for both reading (`Scanner`) and writing (`PrintStream`) at the same time.
  - You will overwrite your input file with an empty file (0 bytes).

# System.out and PrintStream

- The console output object, `System.out`, is a `PrintStream`.

```
PrintStream out1 = System.out;  
PrintStream out2 = new PrintStream(new File("data.txt"));  
out1.println("Hello, console!"); // goes to console  
out2.println("Hello, file!"); // goes to file
```

- A reference to it can be stored in a `PrintStream` variable.
  - Printing to that variable causes console output to appear.
- You can pass `System.out` as a parameter to a method expecting a `PrintStream`.
  - Allows methods that can send output to the console or a file.

# PrintStream question

- **Modify our previous Sections program to use a PrintStream to output to the file sections\_out.txt.**

Section #1:

Sections attended: [9, 6, 7, 4, 3]

Student scores: [20, 18, 20, 12, 9]

Student grades: [100.0, 90.0, 100.0, 60.0, 45.0]

Section #2:

Sections attended: [6, 7, 5, 6, 4]

Student scores: [18, 20, 15, 18, 12]

Student grades: [90.0, 100.0, 75.0, 90.0, 60.0]

Section #3:

Sections attended: [5, 6, 5, 7, 6]

Student scores: [15, 18, 15, 20, 18]

Student grades: [75.0, 90.0, 75.0, 100.0, 90.0]

# PrintStream answer

```
// Section attendance program  
// This version uses a PrintStream for output.
```

```
import java.io.*;  
import java.util.*;
```

```
public class Sections {  
    public static void main(String[] args) throws FileNotFoundException {  
        Scanner input = new Scanner(new File("sections.txt"));  
        PrintStream out = new PrintStream(new File("sections_out.txt"));  
        while (input.hasNextLine()) { // process one section  
            String line = input.nextLine();  
            int[] attended = countAttended(line);  
            int[] points = computePoints(attended);  
            double[] grades = computeGrades(points);  
            results(attended, points, grades, out);  
        }  
    }  
}
```

```
// Produces all output about a particular section.
```

```
public static void results(int[] attended, int[] points,  
    double[] grades, PrintStream out) {  
    out.println("Sections attended: " + Arrays.toString(attended));  
    out.println("Sections scores: " + Arrays.toString(points));  
    out.println("Sections grades: " + Arrays.toString(grades));  
    out.println();  
}  
...
```

# Prompting for a file name

- We can ask the user to tell us the file to read.
  - The file name might have spaces; use `nextLine()`, not `next()`

```
// prompt for input file name
```

```
Scanner console = new Scanner(System.in);
```

```
System.out.print("Type a file name to use: ");
```

```
String filename = console.nextLine();
```

```
Scanner input = new Scanner(new File(filename));
```

- What if the user types a file name that does not exist?

# Fixing file-not-found issues

- File objects have an `exists` method we can use:

```
Scanner console = new Scanner(System.in);
System.out.print("Type a file name to use: ");
String filename = console.nextLine();
File file = new File(filename);

if (!file.exists()) {
    // try a second time
    System.out.print("Try again: ");
    String filename = console.nextLine();
    file = new File(filename);
}
Scanner input = new Scanner(file); // open the file
```

## Output:

```
Type a file name to use: hourz.txt
Try again: hours.txt
```
