Data and expressions

reading: 2.1

The computer's view

Internally, computers store everything as 1's and 0's

```
104 \rightarrow 01101000

"hi" \rightarrow 0110100001101001

h \rightarrow 01101000
```

- How can the computer tell the difference between an h and 104?
- type: A category or set of data values.
 - Constrains the operations that can be performed on data
 - Many languages ask the programmer to specify types
 - Examples: integer, real number, string

Java's primitive types

- primitive types: 8 simple types for numbers, text, etc.
 - Java also has object types, which we'll talk about later

Name	Description	Examples
int	integers (up to 2 ³¹ - 1)	42, -3, 0, 926394
double	real numbers (up to 10 ³⁰⁸)	3.1, -0.25, 9.4e3
char	single text characters	'a', 'X', '?', '\n'
boolean	logical values	true, false

Why does Java distinguish integers vs. real numbers?

Integer or real number?

• Which category is more appropriate?

integer (int)	real number (double)

- 1. Temperature in degrees Celsius
- 2. The population of lemmings
- 3. Your grade point average
- 4. A person's age in years
- 5. A person's weight in pounds
- 6. A person's height in meters

- 7. Number of miles traveled
- 8. Number of dry days in the past month
- 9. Your locker number
- 10. Number of seconds left in a game
- 11. The sum of a group of integers
- 12. The average of a group of integers

credit: Kate Deibel

Expressions

expression: A value or operation that computes a value.

```
• Examples: 1 + 4 * 5
(7 + 2) * 6 / 3
42
"Hello, world!"
```

- The simplest expression is a literal value.
- A complex expression can use operators and parentheses.

Arithmetic operators

- operator: Combines multiple values or expressions.
 - + addition
 - subtraction (or negation)
 - * multiplication
 - / division
 - % modulus (a.k.a. remainder)

- As a program runs, its expressions are evaluated.
 - 1 + 1 evaluates to 2
 - System.out.println(3 * 4); prints 12
 - How would we print the text 3 * 4 ?

Integer division with /

- When we divide integers, the quotient is also an integer.
 - 14 / 4 **is** 3, **not** 3.5

- More examples:
 - 32 / 5 **is** 6
 - 84 / 10 **is** 8
 - 156 / 100 **is** 1
 - Dividing by 0 causes an error when your program runs.

Integer remainder with %

- The % operator computes the remainder from integer division.
 - 14 % 4

• 218 % 5 **is** 3

What is the result?

45 % 6

2 % 2

8 % 20

11 % 0

- Applications of % operator:
 - Obtain last digit of a number: 230857 % 10 is 7
 - Obtain last 4 digits: 658236489 % 10000 **is** 6489
 - See whether a number is odd: 7 % 2 **is** 1, 42 % 2 **is** 0

Remember PEMDAS?

- precedence: Order in which operators are evaluated.
 - Generally operators evaluate left-to-right.

$$1 - 2 - 3$$
 is $(1 - 2) - 3$ which is -4

But * / % have a higher level of precedence than + -

Parentheses can force a certain order of evaluation:

is 18

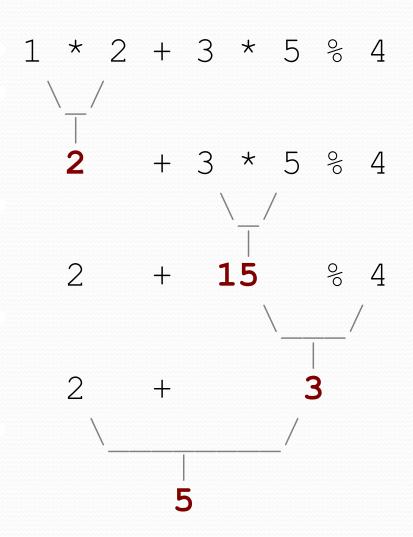

$$(1 + 3) * 4$$
 is 16

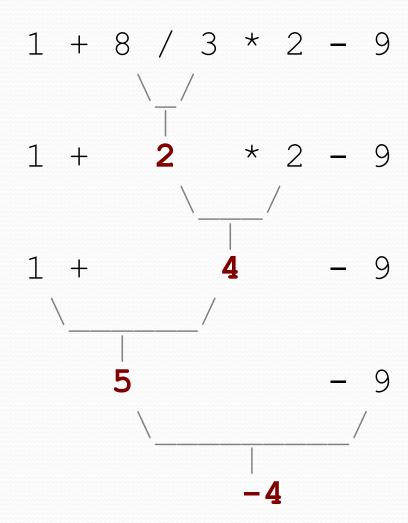

Spacing does not affect order of evaluation

Precedence questions

- What values result from the following expressions?
 - 9 / 5
 - 695 % 20
 - 7 + 6 * 5
 - 7 * 6 + 5
 - 248 % 100 / 5
 - 6 * 3 9 / 4
 - (5 7) * 4
 - 6 + (18 % (17 12))

Precedence examples

Real numbers (type double)

- Examples: 6.022, -42.0, 2.143e17
 - Placing .0 or . after an integer makes it a double.
- The operators + * / % () all still work with double.
 - / produces an exact answer: 15.0 / 2.0 is 7.5
 - Precedence is the same: () before * / % before + -

Precision in real numbers

The computer internally represents real numbers in an imprecise way.

• Example:

```
System.out.println(0.1 + 0.2);
```

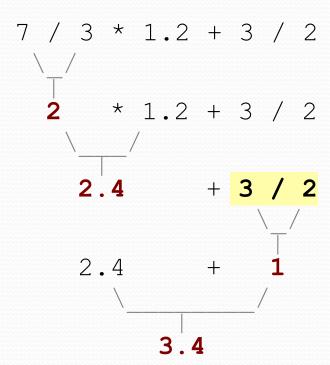

The output is 0.30000000000000004!

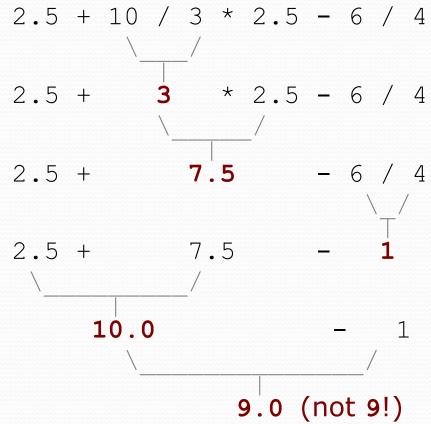

Real number example

Mixing types

- When int and double are mixed, the result is a double.
 - 4.2 * 3 **is** 12.6
- The conversion is per-operator, affecting only its

operands.

• 3 / 2 is 1 above, not 1.5.

String concatenation

 string concatenation: Using + between a string and another value to make a longer string.

- Use + to print a string and an expression's value together.
 - System.out.println("Grade: " + (95.1 + 71.9) / 2);
 - Output: Grade: 83.5

Variables

reading: 2.2

Receipt example

What's bad about the following code?

```
public class Receipt {
    public static void main(String[] args) {
        // Calculate total owed, assuming 8% tax / 15% tip
        System.out.println("Subtotal:");
        System.out.println(38 + 40 + 30);
        System.out.println("Tax:");
        System.out.println((38 + 40 + 30) * .08);
        System.out.println("Tip:");
        System.out.println((38 + 40 + 30) * .15);
        System.out.println("Total:");
        System.out.println(38 + 40 + 30 +
                            (38 + 40 + 30) * .08 +
                            (38 + 40 + 30) * .15);
```

- The subtotal expression (38 + 40 + 30) is repeated
- So many println statements

Variables

- variable: A piece of the computer's memory that is given a name and type, and can store a value.
 - Like preset stations on a car stereo, or cell phone speed dial:

- Steps for using a variable:
 - Declare it state its name and type
 - Initialize it store a value into it
 - Use it print it or use it as part of an expression

Declaration

- variable declaration: Sets aside memory for storing a value.
 - Variables must be declared before they can be used.
- Syntax:

type name;

• int zipcode;

zipcode

double myGPA;

myGPA

Assignment

- assignment: Stores a value into a variable.
 - The value can be an expression; the variable stores its result.
- Syntax:

```
name = expression;
```

• int zipcode;
zipcode = 90210;

zipcode 90210

double myGPA;myGPA = 1.0 + 2.25;

myGPA **3.25**

Using variables

 Once given a value, a variable can be used in expressions:

```
int x;

x = 3;

System.out.println("x is " + x); // x is 3

System.out.println(5 * x - 1); // 14
```

You can assign a value more than once:

```
x 11
```

```
int x;

x = 3;

System.out.println(x + " here"); // 3 here

x = 4 + 7;

System.out.println("now x is " + x); // now x is 11
```

Declaration/initialization

- A variable can be declared/initialized in one statement.
- Syntax:

type name = expression;

• int x = (11 % 3) + 12;

• double myGPA = 3.95;

3.95

Assignment vs. algebra

Assignment uses = , but it is not an algebraic equation.

```
means, "store the value at right in variable at left"
x = 3; means, "x becomes 3" or "x should now store 3"
```

- **ERROR**: 3 = 1 + 2; is an illegal statement, because 3 is not a variable.
- What happens here?

int
$$x = 3;$$

 $x = x + 2;$ // ???

Assignment exercise

• What is the output of the following Java code?

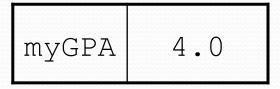

```
int x;
x = 3;
int y = x;
x = 5;
y = y + x;
System.out.println(x);
System.out.println(y);
```

Assignment and types

A variable can only store a value of its own type.

```
• int x = 2.5; // ERROR: incompatible types
```

- An int value can be stored in a double variable.
 - The value is converted into the equivalent real number.
 - double myGPA = 4;

- double avg = **11 / 2**;
 - Why does avg store 5.0 and not 5.5?

Compiler errors

A variable can't be used until it is assigned a value.

```
• int x;
System.out.println(x); // ERROR: x has no value
```

You may not declare the same variable twice.

```
int x;
int x;
int x = 3;
int x = 5;
// ERROR: x already exists
```

How can this code be fixed?

Printing a variable's value

Use + to print a string and a variable's value on one line.

Output:

```
Your grade was 83.2
There are 65 students in the course.
```

Receipt question

Improve the receipt program using variables.

```
public class Receipt {
    public static void main(String[] args) {
        // Calculate total owed, assuming 8% tax / 15% tip
        System.out.println("Subtotal:");
        System.out.println(38 + 40 + 30);
        System.out.println("Tax:");
        System.out.println((38 + 40 + 30) * .08);
        System.out.println("Tip:");
        System.out.println((38 + 40 + 30) * .15);
        System.out.println("Total:");
        System.out.println(38 + 40 + 30 +
                            (38 + 40 + 30) * .15 +
                            (38 + 40 + 30) * .08);
```

Receipt answer

```
public class Receipt {
    public static void main(String[] args) {
        // Calculate total owed, assuming 8% tax / 15% tip
        double subtotal = 38 + 40 + 30;
        double tax = subtotal * .08;
        double tip = subtotal * .15;
        double total = subtotal + tax + tip;

        System.out.println("Subtotal: " + subtotal);
        System.out.println("Tax: " + tax);
        System.out.println("Tip: " + tip);
        System.out.println("Total: " + total);
    }
}
```
