## Welcome to CSE 142!

Kyle Thayer
University of Washington, Summer 2015

Building Java Programs Chapter 1 Lecture 1-1: Introduction; Basic Java Programs

reading: 1.1 - 1.3

## Tips for Success

- Come to lecture!
- Visit website often: <a href="http://cs.washington.edu/142">http://cs.washington.edu/142</a>
- Utilize the resources we provide you:
  - IPL (MGH 334)
  - Come visit me in Office Hours!
  - Your TA
  - Textbook
  - Slides and Lecture examples
  - Message Board
  - Practice-It! <a href="http://practiceit.cs.washington.edu/practiceit/">http://practiceit.cs.washington.edu/practiceit/</a>
- Remember: assignments must be your own work!

## Tips for Success (cont'd)

- Keep up with the assignments
  - The course material is cumulative
- If you don't understand something, ask questions (especially "WHY?").
  - "There's no such thing as a dumb question."
  - Computers are neither magical nor mysterious. Everything can be explained!

## What is computer science?

- Robotics
- Machine Learning / Data Mining
- Artificial Intelligence
- Graphics
- Computer Vision / Natural Language Processing
- User Interfaces
- Security and Privacy
- Computing for Development

• . . .

## What is computer science?

#### **ALGORITHMIC THINKING**

#### al-go-rithm:

a step-by-step procedure for solving a problem or accomplishing some end especially by a computer

## Take this course if you...

- ... like solving tricky problems
- ... like building things
- ... (will) work with large data sets
- ... are curious about how Facebook, Google, etc work
- ... have never written a computer program before
- ... are shopping around for a major
  - 142 is a good predictor of who will enjoy and succeed in CSE
  - ... think "computers and robots are going to take over the world. I want to befriend them so that my life will be spared."

## What is programming?

- program: A set of instructions to be carried out by a computer.
- program execution: The act of carrying out the instructions contained in a program.

- programming language: A systematic set of rules used to describe computations in a format that is editable by humans.
  - We will be studying a programming language called Java.

## Java?

- Relatively simple
- Object-oriented
- Platform independent (Mac, Windows...)
- Widely used
  - #1 in popularity <u>http://www.tiobe.com/index.php/content/paperinfo/tpci/index.</u> html

## Your first Java program!

```
public class Hello {
  public static void main(String[] args) {
     System.out.println("Hello, world!");
  }
}
```

- File must be named Hello.java
- What does this code output (print to the user) when you run (execute) it?

## Bigger Java program!

```
public class Hello {
    public static void main(String[] args) {
        System.out.println("Hello, world!");
        System.out.println();
        System.out.println("This program produces");
        System.out.println("four lines of output");
    }
}
```

#### • Its output:

```
Hello, world!

This program produces four lines of output
```

 console: Text box into which the program's output is printed.

```
Messages | jGRASP Messages | Run | / O |

----jGRASP exec: java Hello

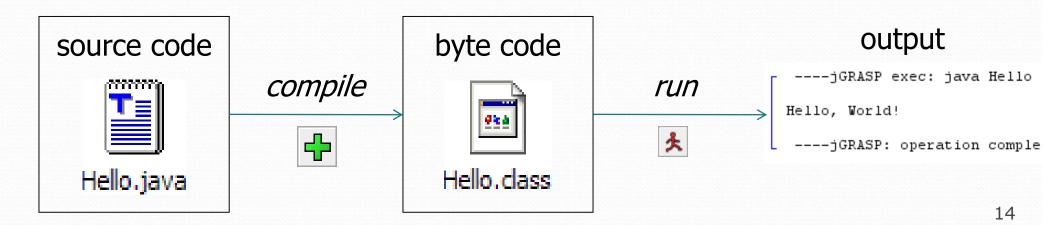

Hello, world!

This program produces four lines of output

----jGRASP: operation complete.
```

## Running a program

- 1. Write it.
  - code or source code: The set of instructions in a program.
- 2. Compile it.
  - compile: Translate a program from one language to another.
  - byte code: The Java compiler converts your code into a format named byte code that runs on many computer types.
- 3. Run (execute) it.
  - output: The messages printed to the user by a program.

Structure of a Java program

- Every executable Java program consists of a class,
  - that contains a method named main,
    - that contains the **statements** (commands) to be executed.

## Names and identifiers

You must give your program a name.

```
public class HelloWorld {
```

- Naming convention: capitalize each word (e.g. MyClassName)
- Your program's file must match exactly (HelloWorld.java)
  - includes capitalization (Java is "case-sensitive")
- identifier: A name given to an item in your program.
  - must start with a letter or or \$
  - subsequent characters can be any of those or a number

```
legal: _myName TheCure ANSWER_IS_42 $bling$illegal: me+u 49ers side-swipe Ph.D's
```

## Keywords

• **keyword**: An identifier that you cannot use because it already has a reserved meaning in Java.

abstract	default	if	private	this
boolean	do	implements	protected	throw
break	double	import	public	throws
byte	else	instanceof	return	transient
case	extends	int	short	try
catch	final	interface	static	void
char	finally	long	strictfp	volatile
class	float	native	super	while
const	for	new	switch	
continue	goto	package	synchronized	

 Note: Because Java is case-sensitive, you could technically use Class or CLaSs as identifiers, but this is very confusing and thus strongly discouraged.

## System.out.println

- A statement that prints a line of output on the console.
  - pronounced "print line" or "print-linn"
- Two ways to use System.out.println:
  - System.out.println("text");Prints the given message as output.
  - System.out.println();Prints a blank line of output.

## Syntax

- syntax: The set of legal structures and commands that can be used in a particular language.
  - The "spelling" and "grammar" of a programming language.
  - Every basic Java statement ends with a semicolon ;
  - The contents of a class or method occur between { and }
- syntax error (compiler error): A problem in the structure of a program that causes the compiler to fail.
  - Missing semicolon
  - Too many or too few { } braces
  - Class and file names do not match
  - ...

## Syntax error example

```
public class Hello {
    pooblic static void main(String[] args) {
        System.owt.println("Hello, world!")_
    }
}
```

#### Compiler output:

- The compiler shows the line number where it found the error.
- The error messages can be tough to understand!
  - Why can't the computer just say "You misspelled 'public""?

## More on syntax errors

- Java is case-sensitive
  - Hello and hello are not the same

```
1 Public class Hello {
2  public static void main(String[] args) {
3    System.out.println("Hello, world!");
4  }
5 }
```

#### compiler output:

```
Hello.java:1: class, interface, or enum expected
Public class Hello {
^
1 error
```

## First lesson in this class

- Computers are stupid.
- Computers can't read minds.
- Computers don't make mistakes.
- If the computer is not doing what you want, it's because
   YOU made a mistake.

# Strings and escape sequences

## Strings

- string: A sequence of text characters.
  - Starts and ends with a " (quotation mark character).
    - The quotes do not appear in the output.
  - Examples:

```
"hello"
"This is a string. It's very long!"
```

- Restrictions:
  - May not span multiple lines.

```
"This is not a legal String."
```

May not contain a " character.

```
"This is not a "legal" String either."
```

This begs the question...

## Escape sequences

 escape sequence: A special sequence of characters used to represent certain special characters in a string.

```
\t tab character
\n new line character
\" quotation mark character
\\ backslash character
```

Example:

```
System.out.println("\\hello\nhow\tare \"you\"?\\\\");
```

Output:

```
\hello
how are "you"?\\
```

## Questions

• What is the output of the following println statements?

```
System.out.println("\ta\tb\tc");
System.out.println("\\\");
System.out.println("'");
System.out.println("\"\"\"");
System.out.println("C:\nin\the downward spiral");
```

• Write a println statement to produce this output:

```
/ \ // \\ /// \\
```

## Answers

• Output of each println statement:

```
a b c
\\
'
"""
C:
in he downward spiral
```

• println statement to produce the line of output:

```
System.out.println("/ \\ // \\\\");
```

## Questions

• What println statements will generate this output?

```
This quote is from
Irish poet Oscar Wilde:

"Music makes one feel so romantic

- at least it always gets on one's nerves - which is the same thing nowadays."
```

• What println statements will generate this output?

```
A "quoted" String is
'much' better if you learn
the rules of "escape sequences."

Also, "" represents an empty String.
Don't forget: use \" instead of "!
'' is not the same as "
```

## Answers

• println statements to generate the output:

```
System.out.println("This quote is from");
System.out.println("Irish poet Oscar Wilde:");
System.out.println();
System.out.println("\"Music makes one feel so romantic");
System.out.println("- at least it always gets on one's nerves -");
System.out.println("which is the same thing nowadays.\"");
```

• println statements to generate the output:

```
System.out.println("A \"quoted\" String is");
System.out.println("'much' better if you learn");
System.out.println("the rules of \"escape sequences.\"");
System.out.println();
System.out.println("Also, \"\" represents an empty String.");
System.out.println("Don't forget: use \\\" instead of \" !");
System.out.println("'' is not the same as \"");
```
