

Building Java Programs

Chapter 3
Lecture 3-1: Parameters and Scope

reading: 3.1

(C) 2012 Ryan North

www.qwantz.com

Scope

- **scope:** The part of a program where a variable exists.
 - From its declaration to the end of the { } braces
 - A variable declared in a `for` loop exists only in that loop.
 - A variable declared in a method exists only in that method.

The diagram illustrates the scope of variables `i` and `x` in a Java code snippet. On the left, a brace labeled "i's scope" encloses the declaration of `i` and the body of the `for` loop. On the right, another brace labeled "x's scope" encloses the declaration of `x` and the entire method body, including the loop iteration. Inside the loop, the text "`// i no longer exists here`" is highlighted in green, indicating that variable `i` is no longer in scope after the loop ends. Similarly, the text "`// x ceases to exist here`" is highlighted in green, indicating that variable `x` is no longer in scope at the end of the method.

```
public static void example() {  
    int x = 3;  
    for (int i = 1; i <= 10; i++) {  
        System.out.println(x);  
    } // i no longer exists here  
} // x ceases to exist here
```

Redundant recipes

- Recipe for baking **20** cookies:
 - Mix the following ingredients in a bowl:
 - **4** cups flour
 - **1** cup butter
 - **1** cup sugar
 - **2** eggs
 - **40** oz. chocolate chips ...
 - Place on sheet and Bake for about 10 minutes.
- Recipe for baking **40** cookies:
 - Mix the following ingredients in a bowl:
 - **8** cups flour
 - **2** cups butter
 - **2** cups sugar
 - **4** eggs
 - **80** oz. chocolate chips ...
 - Place on sheet and Bake for about 10 minutes.

Parameterized recipe

- Recipe for baking **20** cookies:
 - Mix the following ingredients in a bowl:
 - **4** cups flour
 - **1** cup sugar
 - **2** eggs
 - ...
- Recipe for baking **N** cookies:
 - Mix the following ingredients in a bowl:
 - **N/5** cups flour
 - **N/20** cups butter
 - **N/20** cups sugar
 - **N/10** eggs
 - **2N** oz. chocolate chips ...
 - Place on sheet and Bake for about 10 minutes.
- **parameter:** A value that distinguishes similar tasks.

Redundant figures

- Consider the task of printing the following lines/boxes:

* * * * * * * * * *

* * * * *

* *

* * * * * * * *

* *

* * * * * * * *

* * * * *

* *

* *

* * * * *

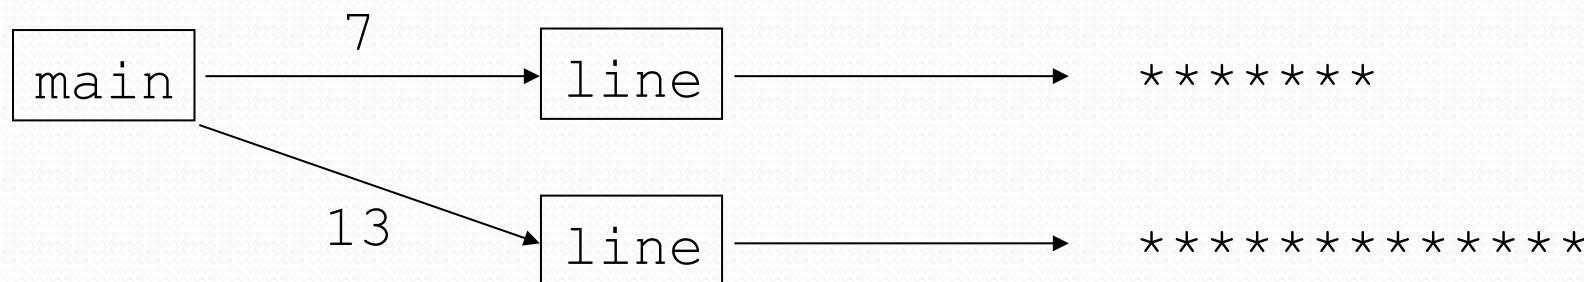

A redundant solution

```
public class Stars1 {  
    public static void main(String[] args) {  
        lineOf13();  
        lineOf7();  
        lineOf35();  
        box10x3();  
        box5x4();  
    }  
  
    public static void lineOf13() {  
        for (int i = 1; i <= 13; i++) {  
            System.out.print("*");  
        }  
        System.out.println();  
    }  
  
    public static void lineOf7() {  
        for (int i = 1; i <= 7; i++) {  
            System.out.print("*");  
        }  
        System.out.println();  
    }  
  
    public static void lineOf35() {  
        for (int i = 1; i <= 35; i++) {  
            System.out.print("*");  
        }  
        System.out.println();  
    }  
    ...  
}
```

- This code is redundant.
- Would variables help?
Would constants help?
- What is a better solution?
 - line - A method to draw a line of any number of stars.
 - box - A method to draw a box of any size.

Parameterization

- **parameter:** A value passed to a method by its caller.
 - Instead of `lineOf7`, `lineOf13`, write `line` to draw any length.
 - When *declaring* the method, we will state that it requires a parameter for the number of stars.
 - When *calling* the method, we will specify how many stars to draw.

Promoting reuse

- Programmers build increasingly complex applications
 - Enabled by existing building blocks, e.g. methods
- The more general a building block, the easier to reuse
- **Abstraction:** focusing on essential properties rather than implementation details
- Algebra is all about abstraction
 - Functions solve an entire class of similar problems

Declaring a parameter

Stating that a method requires a parameter in order to run

```
public static void <name> (<type> <name>) {  
    <statement>(s);  
}
```

- Example:

```
public static void favoriteNumber(<int num>) {  
    ...
```

- When favoriteNumber is called, the caller must specify the integer code to print.

Passing a parameter

Calling a method and specifying values for its parameters

<name> (<expression>) ;

- Example:

```
public static void main(String[] args) {  
    favoriteNumber(42);  
    favoriteNumber(12345);  
}
```

Output:

```
Favorite number is 42  
Favorite number is 12345
```

Using a parameter

Parameter is a local variable that can be used throughout the method by its name

- Example:

```
public static void favoriteNumber(int num) {  
    System.out.println("Favorite number is: " + num);  
}
```

- When `favoriteNumber` is called, parameter `num` is a local variable declared and is initialized to the value given by the caller

Parameters and loops

- A parameter can guide the number of repetitions of a loop.

```
public static void main(String[] args) {  
    chant(3);  
}
```

```
public static void chant(int times) {  
    for (int i = 1; i <= times; i++) {  
        System.out.println("Just a salad...");  
    }  
}
```

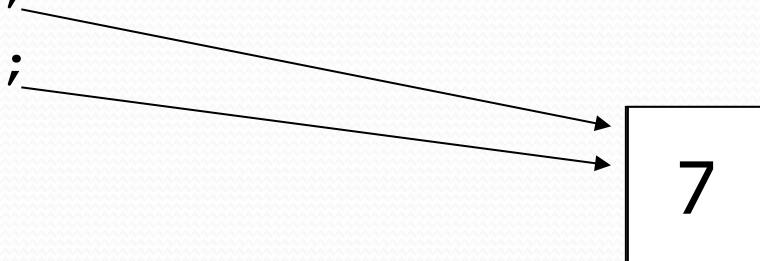

Output:

```
Just a salad...  
Just a salad...  
Just a salad...
```

How parameters are passed

- When the method is called:
 - The value is stored into the parameter variable.
 - The method's code executes using that value.

```
public static void main(String[] args) {  
    chant(3);  
    chant(7);  
}  
  
public static void chant(int times) {  
    for (int i = 1; i <= times; i++) {  
        System.out.println("Just a salad...");  
    }  
}
```

A diagram illustrating parameter passing. Two arrows point from the arguments '3' and '7' in the main method's call to the 'times' parameter in the 'chant' method's definition. Both arrows converge on a single rectangular box containing the number '7', representing the value being passed to the parameter.

Common errors

- If a method accepts a parameter, it is illegal to call it without passing any value for that parameter.

```
chant();      // ERROR: parameter value required
```

- The value passed to a method must be of the correct type.

```
chant(3.7);    // ERROR: must be of type int
```

- Exercise: Change the Stars program to use a parameterized method for drawing lines of stars.

Stars solution

```
// Prints several lines of stars.  
// Uses a parameterized method to remove redundancy.  
public class Stars2 {  
    public static void main(String[] args) {  
        line(13);  
        line(7);  
        line(35);  
    }  
  
    // Prints the given number of stars plus a line break.  
    public static void line(int count) {  
        for (int i = 1; i <= count; i++) {  
            System.out.print("*");  
        }  
        System.out.println();  
    }  
}
```

Multiple parameters

- A method can accept multiple parameters. (separate by ,)
 - When calling it, you must pass values for each parameter.

- Declaration:

```
public static void <name>(<type> <name>, ..., <type> <name>)  
{  
    <statement>(s);  
}
```

- Call:

```
<name> (<exp>, <exp>, ..., <exp>);
```

Multiple parameters example

```
public static void main(String[] args) {  
    printNumber(4, 9);  
    printNumber(17, 6);  
    printNumber(8, 0);  
    printNumber(0, 8);  
}  
  
public static void printNumber(int number, int count) {  
    for (int i = 1; i <= count; i++) {  
        System.out.print(number);  
    }  
    System.out.println();  
}
```

Output:

```
44444444  
171717171717  
00000000
```

- Modify the Stars program to draw boxes with parameters.

Stars solution

```
// Prints several lines and boxes made of stars.  
// Third version with multiple parameterized methods.  
  
public class Stars3 {  
    public static void main(String[] args) {  
        line(13);  
        line(7);  
        line(35);  
        System.out.println();  
        box(10, 3);  
        box(5, 4);  
        box(20, 7);  
    }  
  
    // Prints the given number of stars plus a line break.  
    public static void line(int count) {  
        for (int i = 1; i <= count; i++) {  
            System.out.print("*");  
        }  
        System.out.println();  
    }  
    ...  
}
```

Stars solution, cont'd.

...

```
// Prints a box of stars of the given size.  
public static void box(int width, int height) {  
    line(width);  
  
    for (int line = 1; line <= height - 2; line++) {  
        System.out.print("*");  
        for (int space = 1; space <= width - 2; space++) {  
            System.out.print(" ");  
        }  
        System.out.println("*");  
    }  
  
    line(width);  
}
```

Value semantics

- **value semantics:** When primitive variables (`int`, `double`) are passed as parameters, their values are copied.
 - Modifying the parameter will not affect the variable passed in.

```
public static void strange(int x) {  
    x = x + 1;  
    System.out.println("1. x = " + x);  
}
```

```
public static void main(String[] args) {  
    int x = 23;  
    strange(x);  
    System.out.println("2. x = " + x);  
    ...  
}
```

Output:

```
1. x = 24  
2. x = 23
```

```
public class ParameterMystery {  
    public static void main(String[] args) {  
        int x = 9;  
        int y = 2;  
        int z = 5;
```

5 2 9
~~mystery(z, y, x);~~

~~mystery(y, x, z);~~

}

```
public static void mystery(int x, int z, int y) {  
    System.out.println(z + " and " + (y - x));  
}
```

Output: 2 and 4

```

public class ParameterMystery {
    public static void main(String[] args) {
        int x = 9;
        int y = 2;
        int z = 5;

        mystery(z, y, x);

        mystery(y, x, z);
    }
}

public static void mystery(int x, int z, int y) {
    System.out.println(z + " and " + (y - x));
}

```

Output: 9 and 3

Strings

- **string**: A sequence of text characters.

```
String <name> = "<text>";
```

```
String <name> = <expression resulting in String>;
```

- Examples:

```
String name = "Marla Singer";
```

```
int x = 3;
```

```
int y = 5;
```

```
String point = "(" + x + ", " + y + ")";
```

Strings as parameters

```
public class StringParameters {  
    public static void main(String[] args) {  
        sayHello("Marty");  
  
        String teacher = "Bictolia";  
        sayHello(teacher);  
    }  
  
    public static void sayHello(String name) {  
        System.out.println("Welcome, " + name);  
    }  
}
```

Output:

```
Welcome, Marty  
Welcome, Bictolia
```

- Modify the Stars program to use string parameters. Use a method named repeat that prints a string many times.

Stars solution

```
// Prints several lines and boxes made of stars.  
// Fourth version with String parameters.  
  
public class Stars4 {  
    public static void main(String[] args) {  
        line(13);  
        line(7);  
        line(35);  
        System.out.println();  
        box(10, 3);  
        box(5, 4);  
        box(20, 7);  
    }  
  
    // Prints the given number of stars plus a line break.  
    public static void line(int count) {  
        repeat("*", count);  
        System.out.println();  
    }  
  
    ...
```

Stars solution, cont'd.

...

```
// Prints a box of stars of the given size.  
public static void box(int width, int height) {  
    line(width);  
  
    for (int line = 1; line <= height - 2; line++) {  
        System.out.print("*");  
        repeat(" ", width - 2);  
        System.out.println("*");  
    }  
  
    line(width);  
}  
  
// Prints the given String the given number of times.  
public static void repeat(String s, int times) {  
    for (int i = 1; i <= times; i++) {  
        System.out.print(s);  
    }  
}
```
