

# Building Java Programs

Chapter 7  
Lecture 7-2: Arrays as Parameters

**reading: 7.1-7.3**

# Why did the programmer quit his job?

Because he didn't get arrays.

# Array parameter (declare)

```
public static type methodName(type [] name) {
```

- Example:

// Returns the average of the given array of numbers.

```
public static double average(int[] numbers) {  
    int sum = 0;  
    for (int i = 0; i < numbers.length; i++) {  
        sum += numbers[i];  
    }  
    return (double) sum / numbers.length;  
}
```

- You don't specify the array's length (but you can examine it).

# Array parameter (call)

**methodName (arrayName) ;**

- Example:

```
public class MyProgram {  
    public static void main(String[] args) {  
        // figure out the average TA IQ  
        int[] iq = {126, 84, 149, 167, 95};  
        double avg = average(iq);  
        System.out.println("Average IQ = " + avg);  
    }  
    ...  
}
```

- Notice that you don't write the [] when passing the array.

# Array return (declare)

```
public static type [] methodName(parameters) {
```

- Example:

```
// Returns a new array with two copies of each value.  
// Example: [1, 4, 0, 7] -> [1, 1, 4, 4, 0, 0, 7, 7]  
public static int[] double(int[] numbers) {  
    int[] result = new int[2 * numbers.length];  
    for (int i = 0; i < numbers.length; i++) {  
        result[2 * i] = numbers[i];  
        result[2 * i + 1] = numbers[i];  
    }  
    return result;  
}
```

# Array return (call)

**type [] name = methodName(parameters);**

- Example:

```
public class MyProgram {  
    public static void main(String[] args) {  
        int[] iq = {126, 84, 149, 167, 95};  
        int[] doubled = double(iq);  
        System.out.println(Arrays.toString(doubled));  
    }  
    ...  
}
```

- Output:

[126, 126, 84, 84, 149, 149, 167, 167, 95, 95]

# Array reversal question

- Write code that reverses the elements of an array.
  - For example, if the array initially stores:  
[11, 42, -5, 27, 0, 89]
  - Then after your reversal code, it should store:  
[89, 0, 27, -5, 42, 11]
    - The code should work for an array of any size.
    - Hint: think about swapping various elements...

# Algorithm idea

- Swap pairs of elements from the edges; work inwards:

<i>index</i>	0	1	2	3	4	5
<i>value</i>	89	0	27	-5	42	11
	↑	↑	↑	↑	↑	↑

# Swapping values

```
public static void main(String[] args) {  
    int a = 7;  
    int b = 35;  
// swap a with b?  
a = b;  
b = a;  
    System.out.println(a + " " + b);  
}
```

- What is wrong with this code? What is its output?
- The red code should be replaced with:

```
int temp = a;  
a = b;  
b = temp;
```

# Flawed algorithm

- What's wrong with this code?

```
int[] numbers = [11, 42, -5, 27, 0, 89];  
// reverse the array  
for (int i = 0; i < numbers.length; i++) {  
    int temp = numbers[i];  
    numbers[i] = numbers[numbers.length - 1 - i];  
    numbers[numbers.length - 1 - i] = temp;  
}
```

- The loop goes too far and un-reverses the array! Fixed version:

```
for (int i = 0; i < numbers.length / 2; i++) {  
    int temp = numbers[i];  
    numbers[i] = numbers[numbers.length - 1 - i];  
    numbers[numbers.length - 1 - i] = temp;  
}
```

# Array reverse question 2

- Turn your array reversal code into a `reverse` method.
  - Accept the array of integers to reverse as a parameter.

```
int[] numbers = {11, 42, -5, 27, 0, 89};  
reverse(numbers);
```

- How do we write methods that accept arrays as parameters?
  - Will we need to return the new array contents after reversal?

...

# Reference semantics

**reading: 7.3**

# A swap method?

- Does the following swap method work? Why or why not?

```
public static void main(String[] args) {  
    int a = 7;  
    int b = 35;  
  
    // swap a with b?  
    swap(a, b);  
  
    System.out.println(a + " " + b);  
}  
  
public static void swap(int a, int b) {  
    int temp = a;  
    a = b;  
    b = temp;  
}
```

# Value semantics

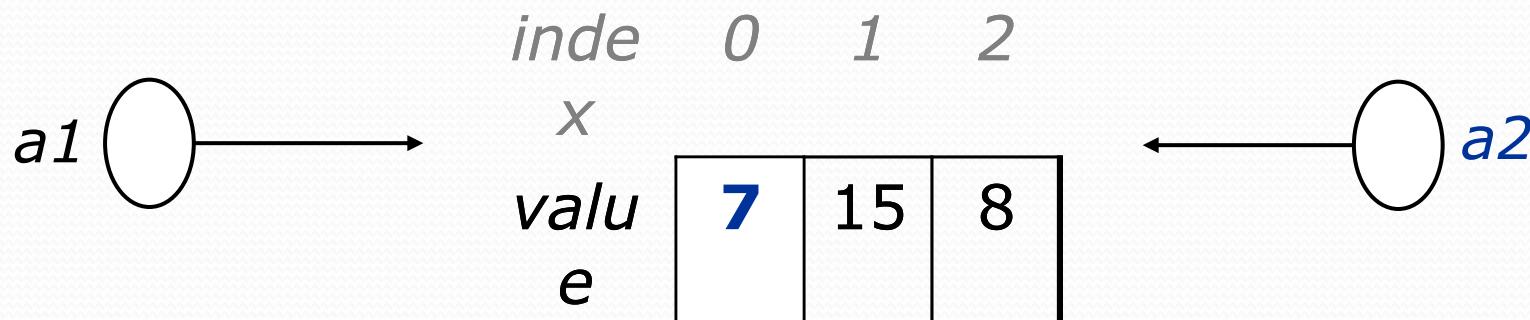

- **value semantics:** Behavior where values are copied when assigned, passed as parameters, or returned.
  - All primitive types in Java use value semantics.
  - When one variable is assigned to another, its value is copied.
  - Modifying the value of one variable does not affect others.

```
int x = 5;  
int y = x;      // x = 5, y = 5  
y = 17;          // x = 5, y = 17  
x = 8;          // x = 8, y = 17
```

# Reference semantics (objects)

- **reference semantics:** Behavior where variables actually store the address of an object in memory.
  - When one variable is assigned to another, the object is *not* copied; both variables refer to the *same object*.
  - Modifying the value of one variable *will* affect others.

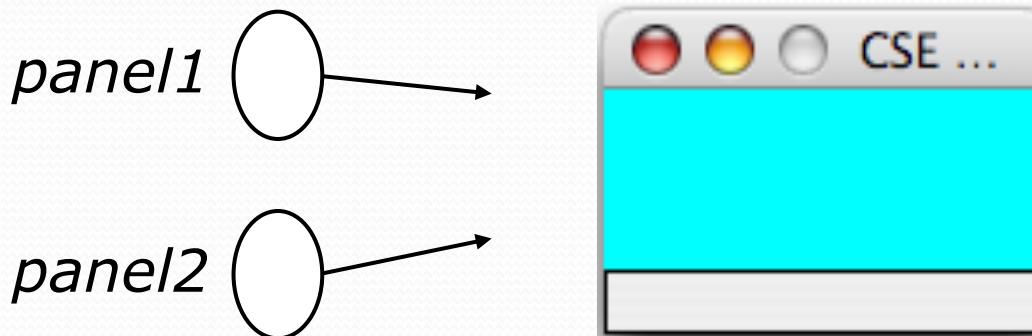

```
int[] a1 = {4, 15, 8};  
int[] a2 = a1;           // refer to same array as a1  
a2[0] = 7;  
System.out.println(Arrays.toString(a1)); // [7, 15, 8]
```

# References and objects

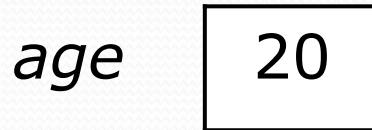

- Arrays and objects use reference semantics. Why?
  - *efficiency.* Copying large objects slows down a program.
  - *sharing.* It's useful to share an object's data among methods.

```
DrawingPanel panel1 = new DrawingPanel(80, 50);  
DrawingPanel panel2 = panel1; // same window  
panel2.setBackground(Color.CYAN);
```

# Value/Reference Semantics

- Variables of primitive types store values directly:

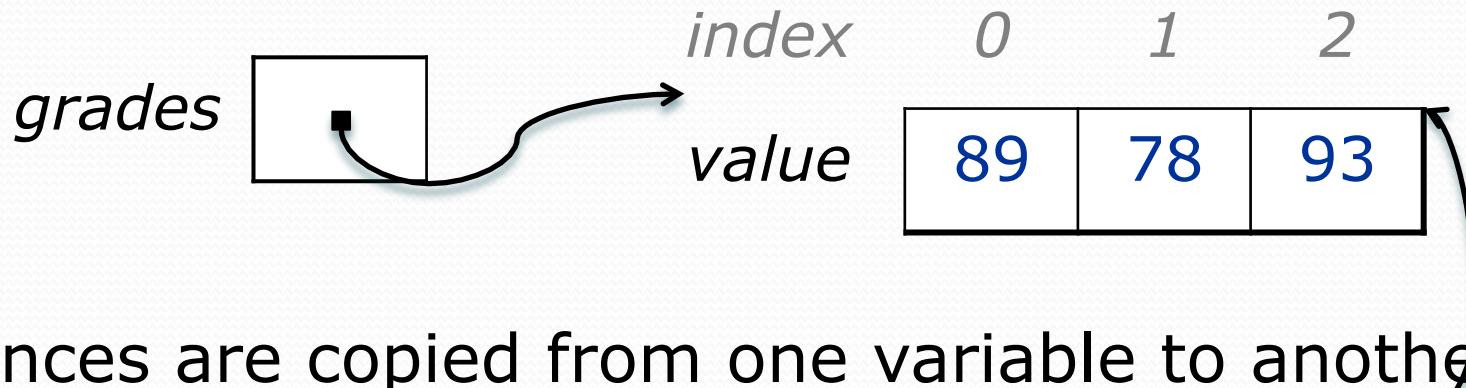

- Values are copied from one variable to another:

`cats = age;`

- Variables of object types store references to memory:

- References are copied from one variable to another:

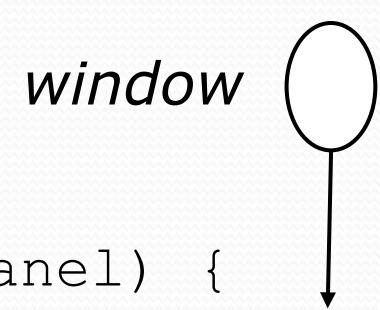

`scores = grades;`

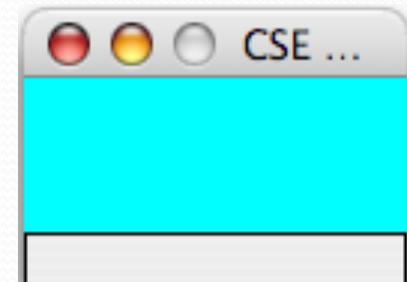

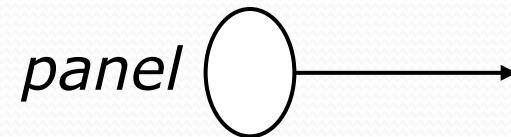

# Objects as parameters

- When an object is passed as a parameter, the object is *not* copied. The parameter refers to the same object.
  - If the parameter is modified, it *will* affect the original object.

```
public static void main(String[] args) {  
    DrawingPanel window = new DrawingPanel(80, 50);  
    window.setBackground(Color.YELLOW);  
    example(window);  
}
```

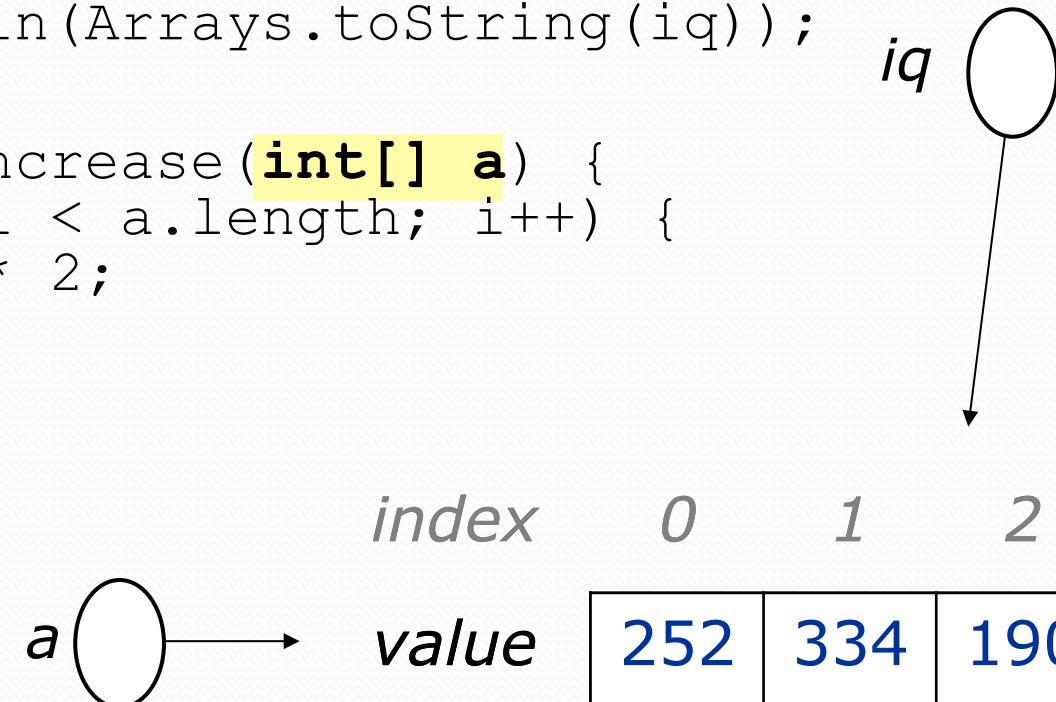

```
public static void example(DrawingPanel panel) {  
    panel.setBackground(Color.CYAN);  
    ...  
}
```

# Arrays pass by reference

- Arrays are passed as parameters by *reference*.
  - Changes made in the method are also seen by the caller.

```
public static void main(String[] args) {  
    int[] iq = {126, 167, 95};  
    increase(iq);  
    System.out.println(Arrays.toString(iq));  
}  
  
public static void increase(int[] a) {  
    for (int i = 0; i < a.length; i++) {  
        a[i] = a[i] * 2;  
    }  
}
```

The diagram illustrates the state of the array 'a' after the 'increase' method is called. An oval labeled 'a' has a line pointing to a horizontal arrow labeled 'value'. To the right of the arrow is a table with three columns. The first column is labeled 'index' and contains '0', '1', and '2'. The second column is labeled 'value' and contains '252', '334', and '190' respectively. This shows that the original array 'iq' was modified in place.

- Output:

[252, 334, 190]

index	0	1	2
value	252	334	190

# Array reverse question 2

- Turn your array reversal code into a `reverse` method.
  - Accept the array of integers to reverse as a parameter.

```
int[] numbers = {11, 42, -5, 27, 0, 89};  
reverse(numbers);
```

- Solution:

```
public static void reverse(int[] numbers) {  
    for (int i = 0; i < numbers.length / 2; i++) {  
        int temp = numbers[i];  
        numbers[i] = numbers[numbers.length - 1 - i];  
        numbers[numbers.length - 1 - i] = temp;  
    }  
}
```

# Array parameter questions

- Write a method `swap` that accepts an arrays of integers and two indexes and swaps the elements at those indexes.

```
int[] a1 = {12, 34, 56};  
swap(a1, 1, 2);  
System.out.println(Arrays.toString(a1)); // [12, 56, 34]
```

- Write a method `swapAll` that accepts two arrays of integers as parameters and swaps their entire contents.
  - Assume that the two arrays are the same length.

```
int[] a1 = {12, 34, 56};  
int[] a2 = {20, 50, 80};  
swapAll(a1, a2);  
System.out.println(Arrays.toString(a1)); // [20, 50, 80]  
System.out.println(Arrays.toString(a2)); // [12, 34, 56]
```

# Array parameter answers

**// Swaps the values at the given two indexes.**

```
public static void swap(int[] a, int i, int j) {  
    int temp = a[i];  
    a[i] = a[j];  
    a[j] = temp;  
}
```

**// Swaps the entire contents of a1 with those of a2.**

```
public static void swapAll(int[] a1, int[] a2) {  
    for (int i = 0; i < a1.length; i++) {  
        int temp = a1[i];  
        a1[i] = a2[i];  
        a2[i] = temp;  
    }  
}
```

# Array return question

- Write a method `merge` that accepts two arrays of integers and returns a new array containing all elements of the first array followed by all elements of the second.

```
int[] a1 = {12, 34, 56};  
int[] a2 = {7, 8, 9, 10};  
int[] a3 = merge(a1, a2);  
System.out.println(Arrays.toString(a3));  
// [12, 34, 56, 7, 8, 9, 10]
```

- Write a method `merge3` that merges 3 arrays similarly.

```
int[] a1 = {12, 34, 56};  
int[] a2 = {7, 8, 9, 10};  
int[] a3 = {444, 222, -1};  
int[] a4 = merge3(a1, a2, a3);  
System.out.println(Arrays.toString(a4));  
// [12, 34, 56, 7, 8, 9, 10, 444, 222, -1]
```

# Array return answer 1

```
// Returns a new array containing all elements of a1
// followed by all elements of a2.
public static int[] merge(int[] a1, int[] a2) {
    int[] result = new int[a1.length + a2.length];
    for (int i = 0; i < a1.length; i++) {
        result[i] = a1[i];
    }
    for (int i = 0; i < a2.length; i++) {
        result[a1.length + i] = a2[i];
    }
    return result;
}
```

# Array return answer 2

```
// Returns a new array containing all elements of a1,a2,a3.  
public static int[] merge3(int[] a1, int[] a2, int[] a3) {  
    int[] a4 = new int[a1.length + a2.length + a3.length];  
    for (int i = 0; i < a1.length; i++) {  
        a4[i] = a1[i];  
    }  
    for (int i = 0; i < a2.length; i++) {  
        a4[a1.length + i] = a2[i];  
    }  
    for (int i = 0; i < a3.length; i++) {  
        a4[a1.length + a2.length + i] = a3[i];  
    }  
    return a4;  
}
```

// Shorter version that calls merge.

```
public static int[] merge3(int[] a1, int[] a2, int[] a3) {  
    return merge(merge(a1, a2), a3);  
}
```
