Building Java Programs

Chapter 4
Advanced if/else; Cumulative sum;

reading: 4.2, 4.4 - 4.5
NEVER HAVE I FELT SO CLOSE TO ANOTHER SOUL

AND YET SO HELPLESSLY ALONE

AS WHEN I GOOGLE AN ERROR

AND THERE’S ONE RESULT

A THREAD BY SOMEONE WITH THE SAME PROBLEM

AND NO ANSWER

LAST POSTED TO IN 2003

WHO WERE YOU, DENVERCODER9?

WHAT DID YOU SEE?!
Advanced if/else

reading: 4.4 - 4.5
Factoring if/else code

- **factoring**: Extracting common/redundant code.
  - Can reduce or eliminate redundancy from if/else code.

**Example:**

```java
if (a == 1) {
    System.out.println(a);
    x = 3;
    b = b + x;
} else if (a == 2) {
    System.out.println(a);
    x = 6;
    y = y + 10;
    b = b + x;
} else { // a == 3
    System.out.println(a);
    x = 9;
    b = b + x;
}
```

```java
System.out.println(a);
if (a == 2) {
    y = y + 10;
}
```

```java
b = b + x;
```
The "dangling if" problem

- What can be improved about the following code?

```java
if (x < 0) {
    System.out.println("x is negative");
} else if (x >= 0) {
    System.out.println("x is non-negative");
}
```

- The second if test is unnecessary and can be removed:

```java
if (x < 0) {
    System.out.println("x is negative");
} else {
    System.out.println("x is non-negative");
}
```

- This is also relevant in methods that use `if` with `return`...
if/else with return

// Returns the larger of the two given integers.
public static int max(int a, int b) {
    if (a > b) {
        return a;
    } else {
        return b;
    }
}

• Methods can return different values using if/else
  • Whichever path the code enters, it will return that value.
  • Returning a value causes a method to immediately exit.
  • All paths through the code must reach a return statement.
All paths must return

```java
public static int max(int a, int b) {
    if (a > b) {
        return a;
    }
    // Error: not all paths return a value
}
```

- The following also does not compile:

```java
public static int max(int a, int b) {
    if (a > b) {
        return a;
    } else if (b >= a) {
        return b;
    }
}
```

- The compiler thinks `if/else/if` code might skip all paths, even though mathematically it must choose one or the other.
Logical operators

• Tests can be combined using *logical operators*:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; &amp;</td>
<td>and</td>
<td>(2 == 3) &amp; &amp; (-1 &lt; 5)</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>!</td>
<td>not</td>
<td>!(2 == 3)</td>
<td>true</td>
</tr>
</tbody>
</table>

• "Truth tables" for each, used with logical values $p$ and $q$:

| p   | q   | p & & q  | p || q  |
|-----|-----|---------|--------|
| true| true| true    | true   |
| true| false| false   | true   |
| false| true| false   | true   |
| false| false| false   | false  |

<table>
<thead>
<tr>
<th>p</th>
<th>!p</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
</tr>
</tbody>
</table>
Evaluating logical expressions

- Relational operators have lower precedence than math; logical operators have lower precedence than relational operators

\[
5 \times 7 \geq 3 + 5 \times (7 - 1) \land 7 \leq 11 \\
5 \times 7 \geq 3 + 5 \times 6 \land 7 \leq 11 \\
35 \geq 3 + 30 \land 7 \leq 11 \\
35 \geq 33 \land 7 \leq 11 \\
true \land true \\
true
\]

- Relational operators cannot be "chained" as in algebra

\[
2 \leq x \leq 10 \\
true \leq 10 \quad \text{(assume that } x \text{ is } 15) \\
Error!
\]

- Instead, combine multiple tests with \( \land \) or \( \lor \)

\[
2 \leq x \land x \leq 10 \\
true \land false \\
false
\]
Logical questions

- What is the result of each of the following expressions?

```plaintext
int x = 42;
int y = 17;
int z = 25;

- y < x && y <= z
- x % 2 == y % 2 || x % 2 == z % 2
- x <= y + z && x >= y + z
- !(x < y && x < z)
- (x + y) % 2 == 0 || !(z - y) % 2 == 0
```

- **Answers:** true, false, true, true, false
Cumulative algorithms

reading: 4.2
Adding many numbers

• How would you find the sum of all integers from 1-1000?

```java
// This may require a lot of typing
int sum = 1 + 2 + 3 + 4 + ... ;
System.out.println("The sum is " + sum);
```

• What if we want the sum from 1 - 1,000,000?
Or the sum up to any maximum?
  • How can we generalize the above code?
Cumulative sum loop

```java
int sum = 0;
for (int i = 1; i <= 1000; i++) {
    sum = sum + i;
}
System.out.println("The sum is " + sum);
```

- **cumulative sum**: A variable that keeps a sum in progress and is updated repeatedly until summing is finished.
- The `sum` in the above code is an attempt at a cumulative sum.
- Cumulative sum variables must be declared `outside` the loops that update them, so that they will still exist after the loop.
Cumulative product

- This cumulative idea can be used with other operators:

```java
int product = 1;
for (int i = 1; i <= 20; i++) {
    product = product * 2;
}
System.out.println("2 ^ 20 = " + product);
```

- How would we make the base and exponent adjustable?
We can do a cumulative sum of user input:

```java
Scanner console = new Scanner(System.in);
int sum = 0;
for (int i = 1; i <= 100; i++) {
    System.out.print("Type a number: ");
    sum = sum + console.nextInt();
}
System.out.println("The sum is " + sum);
```
Cumulative sum question

- Modify the Receipt program from Ch. 2.
  - Prompt for how many people, and each person's dinner cost.
  - Use static methods to structure the solution.

- Example log of execution:

  How many people ate? 4
  Person #1: How much did your dinner cost? 20.00
  Person #2: How much did your dinner cost? 15
  Person #3: How much did your dinner cost? 30.0
  Person #4: How much did your dinner cost? 10.00

  Subtotal: $75.0
  Tax: $6.0
  Tip: $11.25
  Total: $92.25
// This program enhances our Receipt program using a cumulative sum.
import java.util.*;

public class Receipt2 {
    public static void main(String[] args) {
        Scanner console = new Scanner(System.in);
        double subtotal = meals(console);
        results(subtotal);
    }

    // Prompts for number of people and returns total meal subtotal.
    public static double meals(Scanner console) {
        System.out.print("How many people ate? ");
        int people = console.nextInt();
        double subtotal = 0.0; // cumulative sum
        for (int i = 1; i <= people; i++) {
            System.out.print("Person #" + i + ": How much did your dinner cost? ");
            double personCost = console.nextDouble();
            subtotal = subtotal + personCost; // add to sum
        }
        return subtotal;
    }

    ...
Cumulative answer, cont'd.

...
if/else, return question

• Write a method `countFactors` that returns the number of factors of an integer.
  
  • `countFactors(24)` returns 8 because 1, 2, 3, 4, 6, 8, 12, and 24 are factors of 24.

• Solution:

```java
// Returns how many factors the given number has.
public static int countFactors(int number) {
    int count = 0;
    for (int i = 1; i <= number; i++) {
        if (number % i == 0) {
            count++;
            // i is a factor of number
        }
    }
    return count;
}
```
Nested *if/else* question

Formula for body mass index (BMI):

\[ BMI = \frac{\text{weight}}{\text{height}^2} \times 703 \]

### BMI

<table>
<thead>
<tr>
<th>BMI</th>
<th>Weight class</th>
</tr>
</thead>
<tbody>
<tr>
<td>below 18.5</td>
<td>underweight</td>
</tr>
<tr>
<td>18.5 - 24.9</td>
<td>normal</td>
</tr>
<tr>
<td>25.0 - 29.9</td>
<td>overweight</td>
</tr>
<tr>
<td>30.0 and up</td>
<td>obese</td>
</tr>
</tbody>
</table>

**Write a program that produces output like the following:**

This program reads data for two people and computes their body mass index (BMI).

Enter next person's information:
height (in inches)? **70.0**
weight (in pounds)? **194.25**

Enter next person's information:
height (in inches)? **62.5**
weight (in pounds)? **130.5**

Person 1 BMI = 27.868928571428572
overweight
Person 2 BMI = 23.485824
normal
Difference = 4.3831045714285715
// This program computes two people's body mass index (BMI) and
// compares them. The code uses Scanner for input, and parameters/returns.

import java.util.*;  // so that I can use Scanner

public class BMI {
    public static void main(String[] args) {
        introduction();
        Scanner console = new Scanner(System.in);

        double bmi1 = person(console);
        double bmi2 = person(console);

        // report overall results
        report(1, bmi1);
        report(2, bmi2);
        System.out.println("Difference = " + Math.abs(bmi1 - bmi2));
    }

    // prints a welcome message explaining the program
    public static void introduction() {
        System.out.println("This program reads data for two people and");
        System.out.println("computes their body mass index (BMI)." newX);
    }

    ...
Nested if/else, cont'd.

// reads information for one person, computes their BMI, and returns it
public static double person(Scanner console) {
    System.out.println("Enter next person's information:");
    System.out.print("height (in inches)? ");
    double height = console.nextDouble();
    System.out.print("weight (in pounds)? ");
    double weight = console.nextDouble();
    System.out.println();
    double bodyMass = bmi(height, weight);
    return bodyMass;
}

// Computes/returns a person's BMI based on their height and weight.
public static double bmi(double height, double weight) {
    return (weight * 703 / height / height);
}

// Outputs information about a person's BMI and weight status.
public static void report(int number, double bmi) {
    System.out.println("Person " + number + " BMI = " + bmi);
    if (bmi < 18.5) {
        System.out.println("underweight");
    } else if (bmi < 25) {
        System.out.println("normal");
    } else if (bmi < 30) {
        System.out.println("overweight");
    } else {
        System.out.println("obese");
    }
}
