

Dictionaries

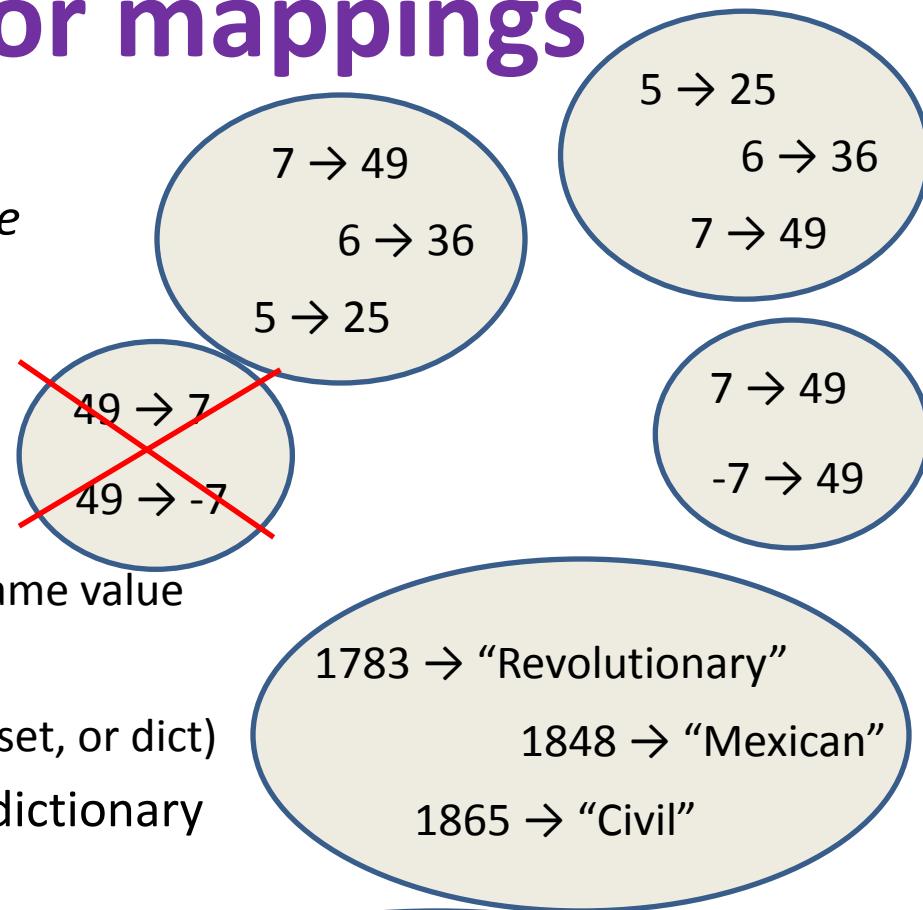

Ruth Anderson

CSE 160

University of Washington

Dictionaries or mappings

- A dictionary maps each *key* to a *value*
- Order does not matter
- Given a key, can look up a value
 - Given a value, cannot look up its key
- **No duplicate keys**
 - Two or more keys may map to the same value
- *Keys* and *values* are Python values
 - **Keys** must be **immutable** (not a list, set, or dict)
- Can add *key* → *value* mappings to a dictionary
 - Can also remove (less common)

"Revolutionary" →

| | |
|------|------|
| 1775 | 1783 |
|------|------|

"Mexican" →

| | |
|------|------|
| 1846 | 1848 |
|------|------|

"Civil" →

| | |
|------|------|
| 1861 | 1865 |
|------|------|

add
mapping

"WWI" →

| | |
|------|------|
| 1917 | 1918 |
|------|------|

"Revolutionary" →

| | |
|------|------|
| 1775 | 1783 |
|------|------|

"Mexican" →

| | |
|------|------|
| 1846 | 1848 |
|------|------|

"Civil" →

| | |
|------|------|
| 1861 | 1865 |
|------|------|

Dictionary syntax in Python

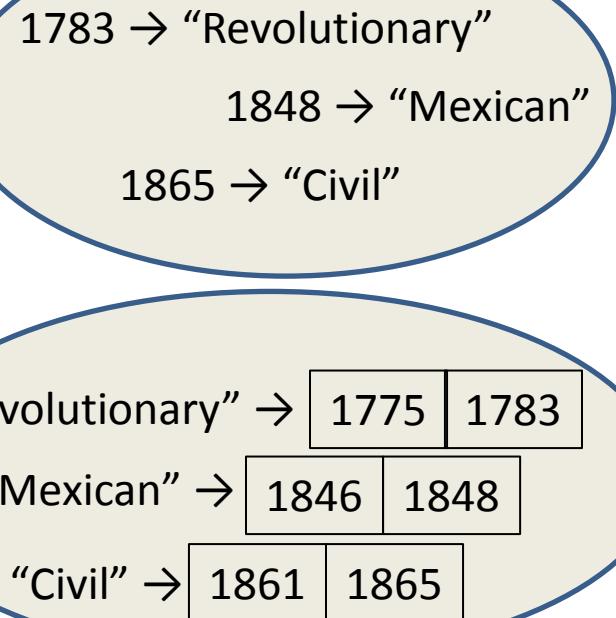

```
d = {}  
d = dict()
```

Two different ways
to create an empty
dictionary

```
us_wars_by_end = {  
    1783: "Revolutionary",  
    1848: "Mexican",  
    1865: "Civil" }  
  
us_wars_by_name = {  
    "Civil" : [1861, 1865],  
    "Mexican" : [1846, 1848],  
    "Revolutionary" : [1775, 1783]  
}
```

- Syntax just like lists, for accessing and setting:

```
us_wars_by_end[1783]      =>  
us_wars_by_end[1783][1:10]  =>  
us_wars_by_name["WWI"] = [1917, 1918]
```

Creating a dictionary

```
>>> state_capitals = {"GA" : "Atlanta", "WA": "Olympia" }
```

“GA” → “Atlanta”
“WA” → “Olympia”

```
>>> phonebook = dict()  
>>> phonebook["Alice"] = "206-555-4455"  
>>> phonebook["Bob"] = "212-555-2211"
```

“Alice” → “206-555-4455”
“Bob” → “212-555-1212”

```
>>> atomic_number = {}  
>>> atomic_number["H"] = 1  
>>> atomic_number["Fe"] = 26  
>>> atomic_number["Au"] = 79
```

“H” → 1
“Fe” → 26
“Au” → 79

Accessing a dictionary

```
>>> atomic_number = {"H":1, "Fe":26, "Au":79}
>>> atomic_number["Au"]
79
>>> atomic_number["B"]
Traceback (most recent call last):
  File "<pyshell#102>", line 1, in <module>
    atomic_number["B"]
KeyError: 'B'
>>> atomic_number.has_key("B")
False
>>> atomic_number.keys()
['H', 'Au', 'Fe']
>>> atomic_number.values()
[1, 79, 26]
>>> atomic_number.items()
[('H', 1), ('Au', 79), ('Fe', 26)]
```

“H” → 1
“Fe” → 26
“Au” → 79

Good for iteration (for loops)

```
for key in mymap.keys():
    val = mymap[key]
    ... use key and val
```

```
for key in mymap:
    val = mymap[key]
    ... use key and val
```

```
for (key,val) in mymap.items():
    ... use key and val
```

Iterating through a dictionary

```
atomic_number = {"H":1, "Fe":26, "Au":79}

# Print out all the keys:
for element_name in atomic_number.keys():
    print element_name

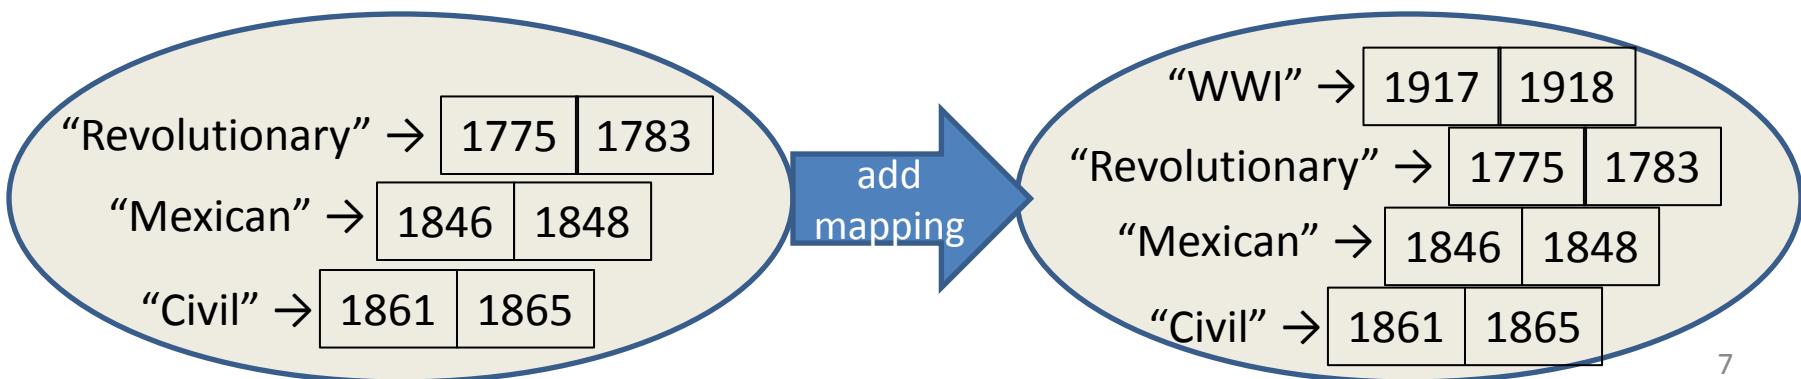

# Another way to print out all the keys:
for element_name in atomic_number:
    print element_name

# Print out the keys and the values
for (element_name, element_number) in atomic_number.items():
    print "name:",element_name, "number:",element_number
```

Modifying a dictionary

```
us_wars1 = {  
    "Revolutionary" : [1775, 1783],  
    "Mexican" : [1846, 1848],  
    "Civil" : [1861, 1865] }
```

```
us_wars1["WWI"] = [1917, 1918] # add mapping  
del us_wars_by_name["Mexican"] # remove mapping
```

Dictionary Exercises

- What does this do?

`squares = { 1:1, 2:4, 3:9, 4:16 }`

`squares[3] + squares[3]`

`squares[3 + 3]`

`squares[2] + squares[2]`

`squares[2 + 2]`

- Convert a list to a dictionary:

- Given [5, 6, 7], produce {5:25, 6:36, 7:49}

- Reverse key with value in a dictionary:

- Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}

Dictionary Exercise (Answers)

- Convert a list to a dictionary:
 - E.g. Given [5, 6, 7], produce {5:25, 6:36, 7:49}

```
d = {}
for i in [5, 6, 7]:  # or range(5, 8)
    d[i] = i * i
```
- Reverse key with value in a dictionary:
 - E.g. Given {5:25, 6:36, 7:49}, produce {25:5, 36:6, 49:7}

```
k = {}
for i in d.keys():
    k[d[i]] = i
```

A list is like a dictionary

- A list maps an integer to a value
 - The integers must be a continuous range 0..*i*

```
mylist = ['a', 'b', 'c']
```

```
mylist[1] ⇒ 'b'
```

```
mylist[3] = 'c'    # error!
```

- In what ways is a list **more** convenient than a dictionary?
- In what ways is a list **less** convenient than a dictionary?

Not every value is allowed to be a key

- Keys must be immutable values
 - int, float, bool, string, *tuple*
 - *not*: list, set, dictionary
- Goal: only dictionary operations change the keyset
 - after “`mydict[x] = y`”, `mydict[x]` \Rightarrow `y`
 - if `a == b`, then `mydict[a] == mydict[b]`
These conditions should hold until `mydict` itself is changed
- Mutable keys can violate these goals

```
list1 = ["a", "b"]
list2 = list1
list3 = ["a", "b"]
mydict = {}
mydict[list1] = "z"           ⇐ Hypothetical; actually illegal in Python
mydict[list3] ⇒ "z"
list2.append("c")
mydict[list1] ⇒ ???
mydict[list3] ⇒ ???
```
