## Tautologies!

Terminology: A compound proposition is a...

- Tautology if it is always true
- Contradiction if it is always false
- Contingency if it can be either true or false
$p \vee \neg p$
$p \oplus p$
$(p \rightarrow q) \wedge p$

## Tautologies!

Terminology: A compound proposition is a...

- Tautology if it is always true
- Contradiction if it is always false
- Contingency if it can be either true or false
$\boldsymbol{p} \vee \neg \boldsymbol{p}$
This is a tautology. It's called the "law of the excluded middle". If $p$ is true, then $p \vee \neg p$ is true. If $p$ is false, then $p \vee \neg p$ is true.
$p \oplus p$
This is a contradiction. It's always false no matter what truth value $p$ takes on.
$(p \rightarrow q) \wedge p$
This is a contingency. When $p=T, q=T,(T \rightarrow T) \wedge T$ is true.
When $p=T, q=F,(T \rightarrow F) \wedge T$ is false.

Logical Equivalence
$A=B$ means $A$ and $B$ are identical "strings":

$$
\begin{aligned}
& -p \wedge q=p \wedge q \\
& -p \wedge q \neq q \wedge p
\end{aligned}
$$

## Logical Equivalence

$A=B$ means $A$ and $B$ are identical "strings":
$-p \wedge q=p \wedge q$
These are equal, because they are character-for-character identical.
$-p \wedge q \neq q \wedge p$
These are NOT equal, because they are different sequences of characters. They "mean" the same thing though.
$A \equiv B$ means $A$ and $B$ have identical truth values:
$-p \wedge q \equiv p \wedge q$
$-p \wedge q \equiv q \wedge p$
$-p \wedge q \not \equiv q \vee p$

## Logical Equivalence

$A=B$ means $A$ and $B$ are identical "strings":
$-p \wedge q=p \wedge q$
These are equal, because they are character-for-character identical.
$-p \wedge q \neq q \wedge p$
These are NOT equal, because they are different sequences of characters. They "mean" the same thing though.
$A \equiv B$ means $A$ and $B$ have identical truth values:
$-p \wedge q \equiv p \wedge q$
Two formulas that are equal also are equivalent.
$-p \wedge q \equiv q \wedge p$
These two formulas have the same truth table!
$-p \wedge q \not \equiv q \vee p$
When $p=T$ and $q=F, p \wedge q$ is false, but $p \vee q$ is true!

## $A \leftrightarrow B$ vs. $A \equiv B$

$A \equiv B$ is an assertion over all possible truth values that $A$ and $B$ always have the same truth values.
$A \leftrightarrow B$ is a proposition that may be true or false depending on the truth values of the variables in $A$ and $B$.
$A \equiv B$ and $(A \leftrightarrow B) \equiv T$ have the same meaning.

## De Morgan's Laws

$$
\begin{aligned}
& \neg(p \wedge q) \equiv \neg p \vee \neg q \\
& \neg(p \vee q) \equiv \neg p \wedge \neg q
\end{aligned}
$$

Negate the statement:
"My code compiles or there is a bug."
To negate the statement, ask "when is the original statement false".

## De Morgan's Laws

$$
\begin{aligned}
& \neg(p \wedge q) \equiv \neg p \vee \neg q \\
& \neg(p \vee q) \equiv \neg p \wedge \neg q
\end{aligned}
$$

Negate the statement:
"My code compiles or there is a bug."
To negate the statement, ask "when is the original statement false".

It's false when not(my code compiles) AND not(there is a bug).

Translating back into English, we get:
My code doesn't compile and there is not a bug.
