## Warm up

Try to prove $a \rightarrow b \equiv \neg b \rightarrow \neg a$ if you didn't get all the way through it last time.

Digital Logic $|$| $\substack{\text { cisin } \\ \text { leatuentum } 200}$ |
| :---: |

## Contrapositive

$$
\begin{aligned}
a \rightarrow b & \equiv \neg a \vee b & & \text { Law of Implication } \\
& \equiv b \vee \neg a & & \text { Commutativity } \\
& \equiv \neg \neg b \vee \neg a & & \text { Double Negation } \\
& \equiv \neg b \rightarrow \neg a & & \text { Law of Implication }
\end{aligned}
$$

All of our rules deal with ORs and ANDs, let's switch the implication to just use AND/NOT/OR.
And do the same with our target
It's ok to work from both ends. In fact it's a very common strategy!
Now how do we get the top to look like the bottom?
Just a few more rules and we're done!

## Announcements

Everyone should have access to gradescope (you should have gotten a sign-up email if you don't already have an account).

If you can't access the course on gradescope, let us know as soon as possible.

Turning in an assignment to gradescope often takes about 15 minutes. You have to tell gradescope which page each problem is on.

## Today

It's notation day!
Two new different ways to represent propositions.

Also vocabulary catch-up.

## Digital Logic

## Digital Circuits

## Computing With Logic

T corresponds to 1 or "high" voltage
F corresponds to 0 or "low" voltage

## Gates

Take inputs and produce outputs (functions)
Several kinds of gates
Correspond to propositional connectives (most of them)

## And Gate

AND Connective vs. AND Gate

| $a \wedge b$ |  |  |
| :---: | :---: | :---: |
| a | b | $a \wedge b$ |
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | F |

| ${ }_{b}-$ AND-OUT |  |  |
| :---: | :---: | :---: |
| a | b | out |
| 1 | 1 | 1 |
| 1 | 0 | 0 |
| 0 | 1 | 0 |
| 0 | 0 | 0 |

"block looks like D of AND"

## Or Gate

## OR Connective vs. OR Gate

| $\mathbf{a} \vee \mathbf{b}$ |
| :---: |
| $\mathbf{a}$ |
| $\mathbf{b}$ |
| $\mathbf{a} \vee \mathbf{b}$ |
| $\mathbf{T}$ |
| $\mathbf{T}$ |
| $\mathbf{T}$ |
| $\mathbf{F}$ |
| $\mathbf{F}$ |
| $\mathbf{T}$ |
| $\mathbf{T}$ |
| $\mathbf{F}$ |
| $\mathbf{T}$ |

| a | b | OUT |
| :---: | :---: | :---: |
| 1 | 1 | 1 |
| 1 | 0 | 1 |
| 0 | 1 | 1 |
| 0 | 0 | 0 |

"arrowhead block looks like V"

## Not Gates

NOT Connective vs.
$\neg a$

| $\mathbf{a}$ | $\neg \mathbf{a}$ |
| :---: | :---: |
| $\mathbf{T}$ | $\mathbf{F}$ |
| $\mathbf{F}$ | $\mathbf{T}$ |

NOT Gate

Also called

| $\mathbf{a}$ | OUT |
| :---: | :---: |
| $\mathbf{1}$ | 0 |
| $\mathbf{0}$ | 1 | inverter

## Blobs are Okay!

You may write gates using blobs instead of shapes!

## Combinational Logic Circuits

Values get sent along wires connecting gates

## Combinational Logic Circuits

Values get sent along wires connecting gates

$$
\neg a \wedge(\neg b \wedge(r \vee s))
$$

## Combinational Logic Circuits

Wires can send one value to multiple gates!

## Combinational Logic Circuits

Wires can send one value to multiple gates!

$$
(a \wedge \neg b) \vee(\neg b \wedge r)
$$

( ${ }^{3}$ Vocabulary Break!

## Vocabulary!

## A proposition is a....

## Tautology if it is always true.

Contradiction if it is always false. Contingency if it can be both true and false.
$a \vee \neg a$
Tautology
If $a$ is true, $a \vee \neg a$ is true; if $a$ is false, $a \vee \neg a$ is true.
$a \bigoplus a$
Contradiction
If $a$ is true, $a \oplus a$ is false; if $a$ is false, $a \oplus a$ is false.
$(a \rightarrow b) \wedge a$
Contingency If $a$ is true and $b$ is true, $(a \rightarrow b) \wedge a$ is true; If $a$ is true and $b$ is false, $(a \rightarrow b) \wedge a$ is false.

## More Vocabulary

$$
a \rightarrow b
$$

$a$ is called the "hypothesis" or "antecedent" (or other names...)
$b$ is called the "conclusion" or "consequent" (or other names...)

## Back to Notation Day

## On notation...

Logic is fundamental. Computer scientists use it in programs, mathematicians use it in proofs, engineers use it in hardware, philosophers use it in arguments,....
...so everyone uses different notation to represent the same ideas.

Since we don't know exactly what you're doing next, we're going to show you a bunch of them; but don't think one is "better" than the others!

## Meet Boolean Algebra

Preferred by some mathematicians and circuit designers.
"or" is +
"and" is • (i.e. "multiply")
"not" is ' (an apostrophe after a variable)

Why?
Mathematicians like to study "operations that work kinda like 'plus' and 'times' on integers."
Circuit designers have a lot of variables, and this notation is more compact.

## Meet Boolean Algebra

| Name | Variables | "True/False" | "And" | "Or" | "Not" | Implication |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Java Code | boolean b | true, false | \& \& | \| | | ! | No special symbol |
| Propositional Logic | " $x, y, a, b, r "$ | T, F | $\wedge$ | V | $\neg$ | $\rightarrow$ |
| Circuits | Wires | 1,0 |  |  |  | No special symbol |
| Boolean Algebra | $a, b, c$ | 1,0 | ("multiplication") | $+$ ("addition") | (apostrophe after variable) | No special symbol |

Propositional logic
$(a \wedge b \wedge r) \vee s \vee \neg t$

Boolean Algebra

$$
a b r+s+t^{\prime}
$$

## Comparison

$$
\begin{array}{cc}
\text { Propositional logic } & \text { Boolean Algebra } \\
(a \wedge b \wedge r) \vee s \vee \neg t & a b r+s+t^{\prime}
\end{array}
$$

Remember this is just an alternate notation for the same underlying ideas.
So that big list of identities? Just change the notation and you get another big list of identities!

## Boolean Algebra

## Axioms

| Closure |  |
| :--- | ---: |
|  |  |
| $a+b$ is in $\mathbb{B}$ |  |
| $a \bullet b$ is in $\mathbb{B}$ |  |

| Commutativity |
| ---: |
| $a+b=b+a$ |
| $a \bullet b=b \bullet a$ |

| Associativity |
| :---: |
| $a+(b+c)=(a+b)+c$ |
| $a \bullet(b \bullet c)=(a \bullet b) \bullet c$ |

| Identity |
| ---: |
| $a+0=a$ |
| $a \bullet 1=a$ |

| Distributivity |
| :--- |
| $a+(b \bullet c)=(a+b) \bullet(a+c)$ |
| $a \bullet(b+c)=(a \bullet b)+(a \bullet c)$ |

| Complementarity |
| ---: |
| $a+a^{\prime}=1$ |
| $a \bullet a^{\prime}=0$ |

## Boolean Algebra

## Theorems

| Null |  |
| :--- | ---: |
|  | $X+1=1$ |
|  | $X \bullet 0=0$ |

| Idempotency |
| ---: |
| $X+X=X$ |
| $X \bullet X=X$ |

| Involution |  |
| :--- | :--- |
|  | $\left(X^{\prime}\right)^{\prime}=X$ |

| Uniting |  |
| ---: | ---: |
|  | $X \bullet Y+X \bullet Y^{\prime}=X$ |
|  | $(X+Y) \bullet\left(X+Y^{\prime}\right)=X$ |

## Boolean Algebra

| Absorbtion |
| :---: |
| $X+X \bullet Y=X$ |
| $\left(X+Y^{\prime}\right) \bullet Y=X \bullet Y$ |
| $X \bullet(X+Y)=X$ |
| $\left(X \bullet Y^{\prime}\right)+Y=X+Y$ |

| DeMorgan |
| :---: |
| $(X+Y+\cdots)^{\prime}=X^{\prime} \bullet Y^{\prime} \bullet \cdots$ |
| $(X \bullet Y \bullet \cdots)^{\prime}=X^{\prime}+Y^{\prime}+\cdots$ |

| Consensus |  |
| :--- | :--- |
|  | $(X \bullet Y)+(Y \bullet Z)+\left(X^{\prime} \bullet Z\right)=X \bullet Y+X^{\prime} \bullet Z$ |
|  | $(X+Y) \bullet(Y+Z) \bullet\left(X^{\prime}+Z\right)=(X+Y) \bullet\left(X^{\prime}+Z\right)$ |

| Factoring |  |
| :--- | ---: |
|  | $(X+Y) \bullet\left(X^{\prime}+Z\right)=X \bullet Z+X^{\prime} \bullet Y$ |
| $X \bullet Y+X^{\prime} \bullet Z$ | $=(X+Z) \bullet\left(X^{\prime}+Y\right)$ |
|  |  |

## An Exercise in Notation

The rest of today we're solving a problem.

See the concepts we learned the last few days "in action" And practice Boolean algebra and propositional logic.

## Today's Goal

Go from a problem statement to code to logical/circuit representation to an "optimized" version.

## Why?

Practice translating between different representations.
Practice applying simplification laws
Historical context! This process is reminiscent of "hardware acceleration" designing custom hardware to do a single task very fast.
Most design is done automatically these days, but it's still nice to see once.

## Our Goal

Given what day of the week it is and what kind of question you have, what's the quickest way to get it answered?
(this is an example, not actual advice)
Input: day of the week, Boolean talkToSomeone
Output: The way to get your question answered, according to the following rules:
On M,Tu,W,F if you want to talk, go to office hours
On Th if you want to talk, go to section
Monday through Friday, if you don't want to talk ask on Ed
On Saturday or Sunday, text a friend (whether you want to talk or not)

## Step One

Input: day of the week, Boolean talkToSomeone
Output: The way to get your question answered, according to the following rules:
On M,Tu,W,F if you want to talk, go to office hours
On Th if you want to talk, go to section
Monday through Friday, if you don't want to talk ask on Ed
On Saturday or Sunday, text a friend (whether you want to talk or not)

Take 2 minutes plan what your code might look like.

## Step One

```
if( (day==Monday || day==Tuesday || day==Wednesday || day===Friday) ) {
    if(talkToSomeone)
            return "office hours";
        else
            return "Ed";
}
else if(day==Thursday) {
    if(talkToSomeone)
            return "section";
        else
            return "Ed";
}
else //day is Saturday or Sunday
    return "text a friend";
```

## One possibility (there are many)

## Step Two

Go from a problem statement to code to logical/circuit representation to an "optimized" version.
We want a logical/circuit representation.

## Step Two

Input? Day in binary and talkToSomeone
Monday - 000
0 for false, 1 for true.
Tuesday - 001
Wednesday - 010
Thursday - 011
Friday - 100

Saturday - 101
Sunday - 110
(invalid) - 111

## Step Two

Output? We'll turn on only the wire for what to do called a "one-hot" encoding, because one wire is on ('hot')

Office Hour - 0
Section - 1

Ed-2
Text a Friend - 3

| --- | 1 | 1 | 1 | 1 |  |  |  |  |

Ick

## WOW that's ugly.

Be careful when wires cross - draw one "jumping over" the other.

## Can we do better

Maybe the factored version will be better?

Ehhhhhhhh, it's a little better?

Part of the problem here is Robbie's art skills.
Part is some layout choices - commuting the terms might make things prettier.

Most of the problem is just the circuit is complicated. out $_{3}$ is a little better.

## Can we use these for anything?

Sometimes these concrete formulas lead to easier observations.
For example, we might have noticed we factored out $s$ or $s^{\prime}$ in three of the four, which suggests switching $s$ first.

```
|if(talkToSomeone) {
    if( (day==Monday || day==Tuesday || day==Wednesday || day==Friday) )
        return "office hours";
    else if( day==Thursday)
            return "section";
    else
            return "text a friend";
}
else
    if( (day==Monday || day==Tuesday || day==Wednesday || day==Thursday || day==Friday) )
            return "Ed";
        else
            return "text a friend";
_}
```

## Can we use these for anything?

Is this code better? Maybe, maybe not.
It's another tool in your toolkit for thinking about logic Including logic you write in code!

```
#if(talkToSomeone) {
    if( (day==Monday || day==Tuesday || day==Wednesday || day==Friday) )
        return "office hours";
    else if( day==Thursday)
        return "section";
    else
        return "text a friend";
}
else
    if( (day==Monday || day==Tuesday || day==Wednesday || day==Thursday || day==Friday) )
        return "Ed";
    else
        return "text a friend";
_}
```

## Takeaways

Yet another notation for propositions.
These are just more representations - there's only one underlying set of rules.

Next time: wrap up digital logic and the tool really represent $x>5$.

## Another Proof

Let's prove that $(a \wedge b) \rightarrow(b \vee a)$ is a tautology.

Alright, what are we trying to show?

## Another Proof

$$
\begin{aligned}
& (a \wedge b) \rightarrow(b \vee a) \equiv \neg(a \wedge b) \vee(b \vee a) \\
& \equiv(\neg a \vee \neg b) \vee(b \vee a) \\
& \text { Proof-writing tip: } \quad \equiv \neg a \vee(\neg b \vee(b \vee a)) \\
& \text { Take a step back. } \equiv \neg a \vee((\neg b \vee b) \vee a) \\
& \text { Pause and carefully look } \equiv \neg a \vee((b \vee \neg b) \vee a) \\
& \text { at what you have. You } \\
& \text { might see where to go } \\
& \text { next... } \\
& \equiv \neg a \vee(\mathrm{~T} \vee a) \text { Law of Implication } \\
& \equiv \neg a \vee(a \vee \mathrm{~T}) \text { ।tBedAgeqan'everything is AND/OR/NOT } \\
& \equiv \neg a \vee a \quad \text { PGemmutative, ol egationther. } \\
& \equiv a \vee \neg a \\
& \text { 三 T } \\
& \text { Strannflytatival legation } \\
& \text { Simplify out the } a, \neg a \text {. }
\end{aligned}
$$

We're done!

## Another Proof

$$
\begin{array}{rlrl}
(a \wedge b) \rightarrow(b \vee a) & \equiv \neg(a \wedge b) \vee(b \vee a) & & \text { Law of implication } \\
& \equiv(\neg a \vee \neg b) \vee(b \vee a) & \text { DeMorgan's Law } \\
& \equiv \neg a \vee(\neg b \vee(b \vee a)) & \text { Associative } \\
& \equiv \neg a \vee((\neg b \vee b) \vee a) & \text { Associative } \\
& \equiv \neg a \vee((b \vee \neg b) \vee a) & \text { Commutative } \\
& \equiv \neg a \vee(\mathrm{~T} \vee a) & & \text { Negation } \\
& \equiv \neg a \vee(a \vee \mathrm{~T}) & & \text { Commutative } \\
& \equiv \neg a \vee a & & \text { Domination } \\
& \equiv a \vee \neg a & & \text { Commutative } \\
& \equiv \mathrm{T} & & \text { Negation }
\end{array}
$$
