The midterm will be Wednesday, May 6 in class. It will be 50 minutes in length and will be closed book. The midterm will cover everything covered in class up to and including the class on May 1. In other words, the midterm will cover Chapter 1 of Sipser and the lecture notes on Myhill-Nerode, minimizing DFAs, and string matching. There will be a review session on Monday, May 4 in EEB 045 6-7:30pm. Here is a handy dandy list of topics you should prepare yourself for:

1. Strings and languages. Operations on languages.
2. Deterministic finite automata: formal definition, state diagrams, $\delta^*$, the language of a DFA
3. Nondeterministic finite automata: formal definition, state diagrams, $\varepsilon$ transitions, the language of a NFA
4. Converting NFAs to DFAs by the subset construction
5. Closure properties of regular operations (complement, intersection, union, star, etc)
6. Regular expressions and their languages
7. Construction of a regular expression representing the language accepted by an NFA
8. Construction of a NFA which recognizes the language of a regular expression
9. The pumping lemma. Proving that a language is not regular using the pumping lemma.
11. Minimizing DFAs
12. String matching. You don’t need to remember the algorithm, but you should know the basic idea of constructing a finite automata like machine to find a substring.

Sample midterms are available on the website.
