CSE 331

2D Graphics

Lecturer: Michael Hotan
slides created by Marty Stepp
http://www.cs.washington.edu/331/
Custom components

• AWT/Swing come with lots of components that you can use to implement a fully-featured GUI.

• But there are cases when you need a custom component.
  ▪ Usually this is when you want to paint custom 2-D graphics.
  ▪ We often call a custom painted component a canvas.

• To do so, write a class that extends JComponent.
  ▪ Override method paintComponent to tell Java how to draw it:

```java
public void paintComponent(Graphics g)
```

• Some programmers extend JPanel rather than JComponent.
A drawing canvas

- Coordinate system: (0, 0) at top-left, x-axis increases rightward, y-axis *downward*.

- Component's surface is *transparent* unless drawn on.

- JComponent's `paintComponent` does important things that we don't want to lose. (e.g. paints the component's background)
  - So call the method `super.paintComponent` first thing.

```java
public void paintComponent(Graphics g) {
    super.paintComponent(g);
    ...
}
```
Quick drawing example

```java
public class MyCanvas extends JComponent {
    public MyCanvas() {
        this.setBackground(Color.WHITE);
    }

    public void paintComponent(Graphics g) {
        super.paintComponent(g);
        g.setPaint(Color.BLUE);
        g.fillOval(10, 10, 20, 50);
    }
}
```
<table>
<thead>
<tr>
<th>Method name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>drawImage(Image, x, y, [w, h], panel)</code></td>
<td>an image at the given x/y position and size</td>
</tr>
<tr>
<td><code>drawLine(x1, y1, x2, y2)</code></td>
<td>line between points (x1, y1), (x2, y2)</td>
</tr>
<tr>
<td><code>drawOval(x, y, width, height)</code></td>
<td>outline largest oval that fits in a box of size width * height with top-left at (x, y)</td>
</tr>
<tr>
<td><code>drawRect(x, y, width, height)</code></td>
<td>outline of rectangle of size width * height with top-left at (x, y)</td>
</tr>
<tr>
<td><code>drawString(text, x, y)</code></td>
<td>text with bottom-left at (x, y)</td>
</tr>
<tr>
<td><code>fillOval(x, y, width, height)</code></td>
<td>fill largest oval that fits in a box of size width * height with top-left at (x, y)</td>
</tr>
<tr>
<td><code>fillRect(x, y, width, height)</code></td>
<td>fill rectangle of size width * height with top-left at (x, y)</td>
</tr>
<tr>
<td><code>setColor(color)</code></td>
<td>paint any following shapes in the given color</td>
</tr>
<tr>
<td><code>setFont(font)</code></td>
<td>draw any following text with the given font</td>
</tr>
</tbody>
</table>
Graphics2D

- The `Graphics` object `g` passed to `paintComponent` is a "graphical context" object to draw on the component.
  - The actual object passed in is a `Graphics2D` (can cast).
    
    ```java
    Graphics2D g2 = (Graphics2D) g;
    ```

- `Graphics2D` is a subclass of `Graphics` that adds new features, new shapes, matrix transformations, color gradients, etc.
  - Added to Java in v1.2 to improve on the features of `Graphics`.
  - Why didn't they just add the new methods and features to `Graphics` directly? Why did they bother to make it a separate class?

  - *Answer*: Open-Closed Principle. Graphics already worked just fine. Why risk breaking it by adding new features to the same file?
# Graphics2D methods

<table>
<thead>
<tr>
<th>method name</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>draw(Shape)</code></td>
<td>draws the outline of a given shape object <em>(replaces drawRect, etc.)</em></td>
</tr>
<tr>
<td><code>fill(Shape)</code></td>
<td>draws the outline and interior of a given shape object</td>
</tr>
<tr>
<td><code>getPaint()</code>, <code>setPaint(Paint)</code></td>
<td>returns or sets the current paint used for drawing <em>(Color is one kind of Paint, but there are others)</em></td>
</tr>
<tr>
<td><code>getStroke()</code>, <code>setStroke(Stroke)</code></td>
<td>returns or sets the current line stroke style used for drawing <em>(can be thin/thick, solid/dashed/dotted, etc.)</em></td>
</tr>
<tr>
<td><code>rotate(angle)</code></td>
<td>rotates any future drawn shapes by the given angle <em>(radians)</em></td>
</tr>
<tr>
<td><code>scale(sx, sy)</code></td>
<td>resizes any future drawn shapes by the given x/y factors</td>
</tr>
<tr>
<td><code>translate(dx, dy)</code></td>
<td>moves any future drawn shapes by the given x/y amounts</td>
</tr>
<tr>
<td><code>setRenderingHint(key, value)</code></td>
<td>sets &quot;rendering hints&quot; such as anti-aliasing and smoothing</td>
</tr>
<tr>
<td><code>shear(shx, shy)</code></td>
<td>gives a slanted perspective to future drawn shapes</td>
</tr>
<tr>
<td><code>transform(t)</code></td>
<td>adds a transformation that will be applied to all shapes</td>
</tr>
</tbody>
</table>
Shapes (java.awt.geom)

- **Arc2D.Double**(x, y, w, h, start, extent, type)
  An arc, which is a portion of an ellipse.

- **Ellipse2D.Double**(x, y, w, h)

- **Line2D.Double**(x1, y1, x2, y2)
  Line2D.Double(p1, p2)
  A line between two points.

- **Rectangle2D.Double**(x, y, w, h)
- **RoundRectangle2D.Double**(x, y, w, h, arcx, arcy)

- **GeneralPath()**
  A customizable polygon.
# Methods of all shapes

<table>
<thead>
<tr>
<th>method name</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>contains(x, y)</code></td>
<td>whether the given point is inside the bounds of this shape</td>
</tr>
<tr>
<td><code>contains(point)</code></td>
<td></td>
</tr>
<tr>
<td><code>contains(rectangle)</code></td>
<td></td>
</tr>
<tr>
<td><code>getBounds()</code></td>
<td>a rectangle representing the bounding box around this shape</td>
</tr>
<tr>
<td><code>getCenterX/Y()</code></td>
<td>various corner or center coordinates within the shape</td>
</tr>
<tr>
<td><code>getMinX/Y()</code></td>
<td></td>
</tr>
<tr>
<td><code>getMaxX/Y()</code></td>
<td></td>
</tr>
<tr>
<td><code>intersects(x, y, w, h)</code></td>
<td>whether this shape touches the given rectangular region</td>
</tr>
<tr>
<td><code>intersects(rectangle)</code></td>
<td></td>
</tr>
</tbody>
</table>
public class MyCanvas extends JComponent {
    public MyCanvas() {
        this.setBackground(Color.WHITE);
    }

    public void paintComponent(Graphics g) {
        super.paintComponent(g);
        Graphics2D g2 = (Graphics2D) g;
        Shape shape = new Ellipse2D.Double(10, 10, 20, 50);
        g2.setPaint(Color.BLUE);
        g2.fill(shape);
    }
}
Colors and paints

- **Color** (a simple single-colored paint)
  - `Color.RED`
  - `public Color(int r, int g, int b)`
  - `public Color(int r, int g, int b, int alpha)`
    - a partially-transparent color (range 0-255, 0=transparent)

- **GradientPaint** (a smooth transition between 2 colors)
  - `public GradientPaint(float x1, float y1, Color color1, float x2, float y2, Color color2)`

- **java.awt.TexturePaint**
  (use an image as a "paint" background)
Strokes (pen styles)

Graphics2D

- public void setStroke(Stroke s)
  Sets type of drawing pen (color, width, style) that will be used by this Graphics2D.

- BasicStroke
  A pen stroke for drawing outlines.

  - public BasicStroke(float width)
  - public BasicStroke(float width, int cap, int join)
  - public BasicStroke(float width, int cap, int join, float miterlimit, float[] dash, float dash_phase)
    - cap can be: CAP_BUTT, CAP_ROUND, CAP_SQUARE
    - join can be: JOIN_BEVEL, JOIN_MITER, JOIN_ROUND
Repainting

• Most canvases are drawing the state of fields, a model, etc.
  ▪ When the state updates, you must tell the canvas to re-draw itself.
  ▪ But you can't call its `paintComponent` method, because you don't have the `Graphics` `g` to pass.

▪ The proper way is to call `repaint` on the canvas instead:
  ```java
  public void repaint()
  ```

  ...
  ```java
  public void update(Observable o, Object arg) {
      myView.repaint(); // perhaps this.repaint();
  }
  ```
Anti-aliasing

- Onscreen text and shapes can have jagged edges, or *aliases*. These can be removed by smoothing, or *anti-aliasing*, the component.

  - `public void setRenderingHint(key, value)`
  - **Example:**
    ```java
    g2.setRenderingHint(
        RenderingHints.KEY_ANTIALIASING,
        RenderingHints.VALUE_ANTIALIAS_ON);
    ```
Creating images

// import java.awt.image.*;

BufferedImage
A blank graphic image buffer surface onto which you can draw

- public BufferedImage(int w, int h, int type)
  - where type is a constant such as BufferedImage.TYPE_INT_ARGB

- public Graphics getGraphics()
  - returns a graphical pen for "drawing on" this image

- you can draw a BufferedImage onto the screen from within the paintComponent method of your canvas:
  - g.drawImage(BufferedImage, x, y, this);
Upload Images

• ImageIO : class that makes it convenient to upload images.

Public static BufferedImage read (File input) throws IOException

Public static BufferedImage read(URL input) throws IOException
Example

- FunImageDisplayer.java
- Graph Application
