Section 8:
Model-View-Controller

Slides adapted from Alex Mariakakis

with material from Krysta Yousoufian, Kellen Donohue, and James Fogarty
HOMEWORK TIPS

- You must include the `@SuppressWarnings("nullness")` tags so that your code will build during grading.
- Run `ant validate` on attu before submitting.
- HW7 requires you to modify your code from HW5 and HW6.
  - Make sure to address any issues you had that caused you to fail HW5 or HW6 staff tests.
The classic design pattern
Used for data-driven user applications
Such apps juggle several tasks:
- Loading and storing the data – getting it in/out of storage on request
- Constructing the user interface – what the user sees
- Interpreting user actions – deciding whether to modify the UI or data
These tasks are largely independent of each other
Model, view, and controller each get one task
talks to data source to retrieve and store data

Which database table is the requested data stored in?

What SQL query will get me the data I need?
asks model for data and presents it in a user-friendly format

Would this text look better blue or red? In the bottom corner or front and center?

Should these items go in a dropdown list or radio buttons?
CONTROLLER

listens for the user to change data or state in the UI, notifying the model or view accordingly

The user just clicked the “hide details” button. I better tell the view.

The user just changed the event details. I better let the model know to update the data.
BENEFITS OF MVC

- **Organization of code**
  - Maintainable, easy to find what you need

- **Ease of development**
  - Build and test components independently

- **Flexibility**
  - Swap out views for different presentations of the same data (ex: calendar daily, weekly, or monthly view)
  - Swap out models to change data storage without affecting user
MVC FLOW IN THEORY

- Model
- View
- Controller
MVC FLOW

- In theory...
  - Pattern of behavior in response to inputs (controller) are independent of visual geometry (view)
  - Controller contacts view to interpret what input events should mean in the context of the view

- In practice...
  - View and controller are so intertwined that they almost always occur in matched pairs (ex: command line interface)
  - Many architectures combine the two
HOMEWORKS

- HW8 – fine to keep view and controller together
- HW9 – separate the view and controller
PUSH VS. PULL

Model

View

Controller
PUSH VS. PULL ARCHITECTURE

- Push architecture
  - As soon as the model changes, it notifies all of the views

- Pull architecture
  - When a view needs to be updated, it asks the model for new data
PUSH VS. PULL ARCHITECTURE
Advantages for push

- Guaranteed to have latest data in case something goes wrong later on

Advantages for pull

- Avoid unnecessary updates, not nearly as intensive on the view
MVC EXAMPLE – TRAFFIC SIGNAL
<table>
<thead>
<tr>
<th>Component</th>
<th>Model</th>
<th>View</th>
<th>Controller</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect cars waiting to enter intersection</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Traffic lights to direct car traffic</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Regulate valid traffic movements</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Manual override for particular lights</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Detect pedestrians waiting to cross</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Pedestrian signals to direct pedestrians</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>External timer which triggers changes at set interval</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
TRAFFIC SIGNAL

- **Model**
  + Stores current state of traffic flow
    - Knows current direction of traffic
    - Capable of skipping a light cycle
  + Stores whether there are cars and/or pedestrians waiting

- **View**
  + Conveys information to cars and pedestrians in a specific direction

- **Controller**
  + Aware of model’s current direction
  + Triggers methods to notify model that state should change
TRAFFIC SIGNAL CODE

- **Model**
  - TrafficModel – keeps track of which lights should be on and off

- **View**
  - CarLight – shows relevant state of TrafficModel to cars
  - PedestrianLight – shows relevant state of TrafficModel to pedestrians

- **Controller**
  - PedestrianButton – notifies TrafficModel that there is a pedestrian waiting
  - CarDetector – notifies TrafficModel that there is a car waiting
  - LightSwitch – enables or disables the light
  - Timer – regulates time in some way, possibly to skip cycles
Apply your generic graph & Dijkstra’s to campus map data

- Given a list of buildings and walking paths
- Produce routes from one building to another on the walking paths
HW8 DATA FORMAT

- List of buildings (abbreviation, name, loc in pixels)
  - BAG Bagley Hall (East Entrance) 1914.5103,1708.8816
  - BGR By George 1671.5499,1258.4333

- List of paths (endpoint 1, endpoint 2, dist in feet)
  - 1903.7201,1952.4322
  - 1906.1864,1939.0633: 26.583482327919597
  - 1897.9472,1960.0194: 20.597253035175832
  - 1915.7143,1956.5: 26.68364745009741
  - 2337.0143,806.8278
  - 2346.3446,817.55768: 29.685363221542797
  - 2321.6193,788.16714: 49.5110360968527
  - 2316.4876,813.59229: 44.65826043418031

- (0,0) is in the upper left
MVC IN HW8

- **Model** stores graph, performs Dijkstra’s
- **View** shows results to users in text format
- **Controller** takes user commands and uses view to show results
- **View** and **Controller** will change in HW9, but **Model** will stay the same
