# **CSE 332: Data Structures and Parallelism**

## Section 1: WorkLists

# WorkList ADT

add(work)	Notifies the worklist that it must handle work			
peek()	Returns the next item to work on			
next()	Removes and returns the next item to work on			
hasWork()	Returns true if there's any work left and false otherwise			

# 0. Odd Jobs

For	each of th	ne follow	ing s	cenarios	, choose		
(1)	an ADT:	Stack	or	0110110 . 3	and		

(2) a data structure: Array Or LinkedList with front Or LinkedList with front and back

Then, explain why your choice works better than the other options.

#### WorkList Situations

(a) You're designing a tool that checks code to verify that all opening brackets, braces, parentheses, ... have closing counterparts.

(b) Disneyland has hired you to find a way to improve the processing efficiency of their long lines at attractions. There is no way to forecast how long the lines will be.

(c) A sandwich shop wants to serve customers in the order that they arrived, but also wants to look ahead to know what people have ordered (ej. 2nd person, 3rd person, ..., last person in line).

### 1. Trie to Delete 0's and 1's?

Suppose we inserted all possible binary strings of length 0-3 (ej. 1, 0, 10, ..., 110, 111) into a Trie.

- (a) If we deleted all binary numbers of length 2, how many nodes would we have to delete?
- (b) After part a, if we deleted all binary numbers of length 3, how many nodes would we have to delete?

# 2. Call Me Maybe

- (a) Suppose you want to transfer someone's phone book to a data structure so that you can call all the phone numbers with a particular area code efficiently. What data structure would you use? How would you implement it?
- (b) What is the time complexity of your solution? What is the space complexity?

### 3. Let's Trie to be Old School

Text on nine keys (T9)'s objective is to make it easier to type text messages with 9 keys. It allows words to be entered by a single keypress for each letter in which several letters are associated with each key. It combines the groups of letters on each phone key with a fast-access dictionary of words. It looks up in the dictionary all words corresponding to the sequence of keypresses and orders them by frequency of use. So for example, the input '2665' could be the words {book, cook, cool}. Describe how you would implement a T9 dictionary for a mobile phone.

T9 Example
