

# CSE 332 Autumn 2023

## Lecture 5: Priority Queues

Nathan Brunelle

<http://www.cs.uw.edu/332>

# Goals for Algorithm Analysis

- Identify a *function* which maps the algorithm's input size to a measure of resources used
  - Domain of the function: **sizes** of the input
    - Number of characters in a string, number of items in a list, number of pixels in an image
  - Codomain of the function: **counts** of resources used
    - Number of times the algorithm adds two numbers together, number times the algorithm does a  $>$  or  $<$  comparison, maximum number of bytes of memory the algorithm uses at any time
- Important note: Make sure you know the “units” of your domain and codomain!
  - Domain = inputs to the function
  - Codomain = outputs to the function

# Worst Case Running Time Analysis

- If an algorithm has a worst case running time of  $f(n)$ 
  - Among all possible size- $n$  inputs, the “worst” one will do  $f(n)$  “operations”
  - I.e.  $f(n)$  gives the maximum operation count from among all inputs of size  $n$

# Comparing

$$f(n) \in O(g(n))$$

$$f(n) \in \Theta(g(n))$$

$$f(n) \in \Omega(g(n))$$

# Asymptotic Notation

- $O(g(n))$ 
  - The **set of functions** with asymptotic behavior less than or equal to  $g(n)$
  - **Upper-bounded** by a constant times  $g$  for large enough values  $n$
  - $f \in O(g(n)) \equiv \exists c > 0. \exists n_0 > 0. \forall n \geq n_0. f(n) \leq c \cdot g(n)$
- $\Omega(g(n))$ 
  - the **set of functions** with asymptotic behavior greater than or equal to  $g(n)$
  - **Lower-bounded** by a constant times  $g$  for large enough values  $n$
  - $f \in \Omega(g(n)) \equiv \exists c > 0. \exists n_0 > 0. \forall n \geq n_0. f(n) \geq c \cdot g(n)$
- $\Theta(g(n))$ 
  - “**Tightly**” within constant of  $g$  for large  $n$
  - $\Omega(g(n)) \cap O(g(n))$

# Asymptotic Notation Example

- Show:  $10n + 100 \in O(n^2)$ 
  - **Technique:** find values  $c > 0$  and  $n_0 > 0$  such that  $\forall n > n_0. 10n + 100 \leq c \cdot n^2$
  - **Proof:**

# Asymptotic Notation Example

- Show:  $10n + 100 \in O(n^2)$ 
    - **Technique:** find values  $c > 0$  and  $n_0 > 0$  such that  $\forall n \geq n_0. 10n + 100 \leq c \cdot n^2$
    - **Proof:** Let  $c = 10$  and  $n_0 = 6$ . Show  $\forall n \geq 6. 10n + 100 \leq 10n^2$ 
      - $10n + 100 \leq 10n^2$
      - $\equiv n + 10 \leq n^2$
      - $\equiv 10 \leq n^2 - n$
      - $\equiv 10 \leq n(n - 1)$
- This is True because  $n(n - 1)$  is strictly increasing and  $6(6 - 1) > 10$

# Asymptotic Notation Example

- Show:  $13n^2 - 50n \in \Omega(n^2)$ 
  - **Technique:** find values  $c > 0$  and  $n_0 > 0$  such that  $\forall n \geq n_0. 13n^2 - 50n \geq c \cdot n^2$
  - **Proof:**

# Asymptotic Notation Example

- Show:  $13n^2 - 50n \in \Omega(n^2)$ 
    - **Technique:** find values  $c > 0$  and  $n_0 > 0$  such that  $\forall n \geq n_0. 13n^2 - 50n \geq c \cdot n^2$
    - **Proof:** let  $c = 12$  and  $n_0 = 50$ . Show  $\forall n \geq 50. 13n^2 - 50n \geq 12n^2$ 
      - $13n^2 - 50n \geq 12n^2$
      - $\equiv n^2 - 50n \geq 0$
      - $\equiv n^2 \geq 50n$
      - $\equiv n \geq 50$
- This is certainly true  $\forall n \geq 50$ .

# Worst Case Running Time - Example

```
myFunction(List n){
  b = 55 + 5;
  c = b / 3;
  b = c + 100;
  for (i = 0; i < n.size(); i++) {
    b++;
  }
  if (b % 2 == 0) {
    c++;
  }
  else {
    for (i = 0; i < n.size(); i++) {
      c++;
    }
  }
  return c;
}
```

Questions to ask:

- What are the units of the input size?
- What are the operations we're counting?
- For each line:
  - How many times will it run?
  - How long does it take to run?
  - Does this change with the input size?

# Worst Case Running Time – Example 2

```
beAnnoying(List n){
  List m = [];
  for (i=0; i < n.size(); i++){
    m.add(n[i]);
    for (j=0; j< n.size(); j++){
      print ("Hi, I'm annoying");
    }
  }
  return;
}
```

Questions to ask:

- What are the units of the input size?
- What are the operations we're counting?
- For each line:
  - How many times will it run?
  - How long does it take to run?
  - Does this change with the input size?

# Gaining Intuition

- When doing asymptotic analysis of functions:
  - If multiple expressions are added together, ignore all but the “biggest”
    - If  $f(n)$  grows asymptotically faster than  $g(n)$ , then  $f(n) + g(n) \in \Theta(f(n))$
  - Ignore all multiplicative constants
    - $f(n) + c \in \Theta(f(n))$  for any constant  $c \in \mathbb{R}$
  - Ignore bases of logarithms
  - Do NOT ignore:
    - Non-multiplicative and non-additive constants (e.g. in exponents, bases of exponents)
    - Logarithms themselves

# More Examples

- Is each of the following True or False?
  - $4 + 3n \in O(n)$
  - $n + 2 \log n \in O(\log n)$
  - $\log n + 2 \in O(1)$
  - $n^{50} \in O(1.1^n)$
  - $3^n \in \Theta(2^n)$

# Common Categories

- $O(1)$  “constant”
- $O(\log n)$  “logarithmic”
- $O(n)$  “linear”
- $O(n \log n)$  “log-linear”
- $O(n^2)$  “quadratic”
- $O(n^3)$  “cubic”
- $O(n^k)$  “polynomial”
- $O(k^n)$  “exponential”

# Defining your running time function

- **Worst-case complexity:**
  - max number of steps algorithm takes on “most challenging” input
- **Best-case complexity:**
  - min number of steps algorithm takes on “easiest” input
- **Average/expected complexity:**
  - avg number of steps algorithm takes on random inputs (context-dependent)
- **Amortized complexity:**
  - max total number of steps algorithm takes on  $M$  “most challenging” consecutive inputs, divided by  $M$  (i.e., divide the max total sum by  $M$ ).

# ADT: Queue

- What is it?
  - A “First In First Out” (FIFO) collection of items
- What Operations do we need?
  - Enqueue
    - Add a new item to the queue
  - Dequeue
    - Remove the “oldest” item from the queue
  - Is\_empty
    - Indicate whether or not there are items still on the queue

# ADT: Priority Queue

- What is it?
  - A collection of items and their “priorities”
  - Allows quick access/removal to the “top priority” thing
- What Operations do we need?
  - insert(item, priority)
    - Add a new item to the PQ with indicated priority
    - Usually, smaller priority value means more important
  - deleteMin
    - Remove and return the “top priority” item from the queue
  - Is\_empty
    - Indicate whether or not there are items still on the queue
- Note: the “priority” value can be any type/class so long as it’s comparable (i.e. you can use “<” or “compareTo” with it)

# Priority Queue, example

```
PriorityQueue PQ = new PriorityQueue();
```

```
PQ.insert(5,5)
```

```
PQ.insert(6,6)
```

```
PQ.insert(1,1)
```

```
PQ.insert(3,3)
```

```
PQ.insert(8,8)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

# Priority Queue, example

```
PriorityQueue PQ = new PriorityQueue();
```

```
PQ.insert(5,5)
```

```
PQ.insert(6,6)
```

```
PQ.insert(1,1)
```

```
Print(PQ.deleteMin)
```

```
PQ.insert(3,3)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

```
PQ.insert(8,8)
```

```
Print(PQ.deleteMin)
```

```
Print(PQ.deleteMin)
```

Applications?

# Thinking through implementations

Data Structure	Worst case time to insert	Worst case time to deleteMin
Unsorted Array		
Unsorted Linked List		
Sorted Circular Array		
Sorted Linked List		
Binary Search Tree		

Note: Assume we know the maximum size of the PQ in advance

# Thinking through implementations

Data Structure	Worst case time to insert	Worst case time to deleteMin
Unsorted Array	$\Theta(1)$	$\Theta(n)$
Unsorted Linked List	$\Theta(1)$	$\Theta(n)$
Sorted Circular Array	$\Theta(\log n)$	$\Theta(n)$
Sorted Linked List	$\Theta(n)$	$\Theta(1)$
Binary Search Tree	$\Theta(n)$	$\Theta(1)$

Note: Assume we know the maximum size of the PQ in advance

# Heap – Priority Queue Data Structure

- Idea: We need to keep some ordering, but it doesn't need to be perfectly sorted
- $\Theta(\log n)$  worst case for deleteMin and insert

# Heap – Priority Queue Data Structure

- Idea: We need to keep some ordering, but it doesn't need to be perfectly sorted
- $\Theta(\log n)$  worst case for deleteMin and insert

# Tree Terminology – Review?

- $\text{root}(T)$ :
- $\text{leaves}(T)$ :
- $\text{children}(3)$ :
- $\text{parent}(4)$ :
- $\text{siblings}(7)$ :
- $\text{ancestors}(9)$ :
- $\text{descendants}(3)$ :
- $\text{subtree}(4)$ :
- $\text{height}(T)$ :
- $\text{depth}(4)$ :
- $\text{branchingFactor}(T)$ :

# Trees for Heaps

- Binary Trees:
  - The branching factor is 2
  - Every node has  $\leq 2$  children
- Complete Tree:
  - All “layers” are full, except the bottom
  - Bottom layer filled left-to-right

# Challenge!

- What is the maximum number of total nodes in a binary tree of height  $h$ ?
- If I have  $n$  nodes in a binary tree, what is the its minimum height?

# Challenge!

- What is the maximum number of total nodes in a binary tree of height  $h$ ?
  - $2^{h+1} - 1$
  - $\Theta(2^h)$
- If I have  $n$  nodes in a binary tree, what is its minimum height?
  - $\lceil \log_2 n \rceil$
  - $\Theta(\log n)$
- **Heap Idea:**
  - If  $n$  values are inserted into a complete tree, the height will be roughly  $\log n$
  - Ensure each insert and deleteMin requires just one “trip” from root to leaf

# Heap Data Structure

- Keep items in a complete binary tree
- Maintain the “Heap Property” of the tree
  - Every node’s priority is  $\leq$  its children’s priority
- Where is the min?
- How do I insert?
- How do I deleteMin?
- How to do it in Java?

# Heap Insert

1.5

```
insert(item){
```

```
    put item in the “next open” spot (keep tree complete)
```

```
    while (item.priority < parent(item).priority){
```

```
        swap item with parent
```

```
    }
```

```
}
```

# Heap Insert

```
insert(item){
```

```
    put item in the “next open” spot (keep tree complete)
```

```
    while (item.priority < parent(item).priority){
```

```
        swap item with parent
```

```
    }
```

```
}
```

# Heap Insert

```
insert(item){
```

```
  put item in the “next open” spot (keep tree complete)
```

```
  while (item.priority < parent(item).priority){
```

```
    swap item with parent
```

```
  }
```

```
}
```

Percolate Up

# Heap Insert

```
insert(item){
```

```
  put item in the "next open" spot (keep tree complete)
```

```
  while (item.priority < parent(item).priority){
```

```
    swap item with parent
```

```
  }
```

```
}
```

Percolate Up

# Heap Insert

```
insert(item){
```

```
    put item in the “next open” spot (keep tree complete)
```
