CSE 333
Lecture 1 - Intro, C refresher

Steve Gribble
Department of Computer Science & Engineering
University of Washington
Welcome!

Today’s goals:

- introductions
- course syllabus
- quick C refresher
Us

Steve Gribble

Elliott Brossard

Chuong Dao
Overloading

The overload signup sheet is down here
- come sign up after lecture
- I’ll hand the sheet in to the ugrad advisors
- by Friday, they’ll let me (and you) know who gets in
Welcome!

Today’s goals:
- introductions
- course syllabus
- quick C refresher
Course map: 100,000 foot view

- C application
  - C standard library (glibc)
- C++ application
  - C++ STL / boost / standard library
- Java application
  - JRE

Hardware
- CPU
- memory
- storage
- network
- GPU
- clock
- audio
- radio
- peripherals

Operating system

OS / app interface (system calls)
- (x86 + devices)
Systems programming

The programming skills, engineering discipline, and knowledge you need to build a system

- **programming**: C / C++
- **discipline**: testing, debugging, performance analysis
- **knowledge**: long list of interesting topics
  - concurrency, OS interfaces and semantics, techniques for consistent data management, distributed systems algorithms, ...
  - most important: a deep understanding of the “layer below”
  - quiz: *is data safely on disk after a “write( )” system call returns?*
Discipline?!?

Cultivate good habits, encourage clean code

- coding style conventions
- unit testing, code coverage testing, regression testing
- documentation (code comments, design docs)
- code reviews

Will take you a lifetime to learn

- but oh-so-important, especially for systems code
  - avoid write-once, read-never code
What you will be doing

Attending lectures and sections
- lecture: ~29 of them, MWF in this room
- sections: ~10 of them, Thu (8:30 in MGH or 9:30 in SAV)

Doing programming projects
- 5 of them, successively building on each other
- includes C, C++; file system, network

Doing programming exercises
- one per lecture, due before the next lecture begins
- coarse-grained grading (0,1,2,3)
Exams

I’m open to alternatives....
- none
- midterm only
- midterm + final

What’s your preference?
Course calendar

Linked off of the course web page
- master schedule for the class
- will contain links to:
  - lecture slides
  - code discussed in lectures
  - assignments, exercises (including due dates)
  - optional “self-exercise” solutions
Welcome!

Today’s goals:

- introductions
- course syllabus
- quick C refresher
C

Created in 1972 by Dennis Ritchie
- designed for creating system software
- portable across machine architectures
- most recently updated in 1999 (C99) and 2011 (C11)

Characteristics
- low-level, smaller standard library than Java
- procedural (not object-oriented)
- typed but unsafe; incorrect programs can fail spectacularly
C workflow

Editor (emacs, vi) or IDE (eclipse)

source files (.c, .h)

foo.h

foo.c

bar.c

compile

object files (.o)

foo.o

From C to machine code

C source file (dosum.c)

C compiler (gcc -S)

assembly source file (dosum.s)

machine code (dosum.o)

```c
int dosum(int i, int j) {
    return i+j;
}
```

```
dosum:
pushl %ebp
movl %esp, %ebp
movl 12(%ebp), %eax
addl 8(%ebp), %eax
popl %ebp
ret
```
Most C compilers generate .o files (machine code) directly
- i.e., without actually saving the readable .s assembly file

```
dosum.c gcc -S dosum.s as dosum.o

gcc -c
```
Multi-file C programs

C source file (dosum.c)

```c
int dosum(int i, int j) {
    return i+j;
}
```

C source file (sumnum.c)

```c
#include <stdio.h>

int main(int argc, char **argv) {
    printf("%d\n", dosum(1, 2));
    return 0;
}
```

dosum() is implemented in sumnum.c

this “prototype” of dosum() tells gcc about the types of dosum’s arguments and its return value
Multi-file C programs

C source file (dosum.c)

```c
#include <stdio.h>

int dosum(int i, int j) {
    return i+j;
}
```

C source file (sumnum.c)

```c
int main(int argc, char **argv) {
    printf("%d \n", dosum(1,2));
    return 0;
}
```

why do we need this `#include`?

where is the implementation of `printf`?
Compiling multi-file programs

- Multiple object files are **linked** to produce an executable
- Standard libraries (libc, crt1, ...) are usually also linked in
- A library is just a pre-assembled collection of .o files

```
 gcc -c dosum.c  
 gcc -c sumnum.c  
 gcc -c dosum.o  
 gcc -c sumnum.o  
 ld  
 (or gcc)  
 libraries  
 (e.g., libc)  

sumnum
```
Object files

sumnum.o, dosum.o are **object files**

- each contains machine code produced by the compiler
- each might contain references to external symbols
  - variables and functions not defined in the associated .c file
  - e.g., sumnum.o contains code that relies on printf() and dosum( ), but these are defined in libc.a and dosum.o, respectively
- linking resolves these external symbols while smooshing together object files and libraries
Let’s dive into C itself

Things that are the same as Java

- syntax for statements, control structures, function calls
- types: int, double, char, long, float
- type-casting syntax:  
  ```
  float x = (float) 5 / 3;
  ```
- expressions, operators, precedence
  ```
  + - * / % ++ -- = += -= *= /= %= < <= == != > >= && || !
  ```
- scope (local scope is within a set of { } braces)
- comments:  
  ```
  /* comment */  // comment
  ```
Primitive types in C

integer types
- char, int

floating point
- float, double

modifiers
- short [int]
- long [int, double]
- signed [char, int]
- unsigned [char, int]

---

### Primitive Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Bytes (32 bit)</th>
<th>Bytes (64 bit)</th>
<th>32 bit range</th>
<th>Printf</th>

---

*see sizeofs.c*
C99 extended integer types

Solves the conundrum of “how big is a long int?”

```c
#include <stdint.h>

void foo(void) {
    int8_t  w;  // exactly 8 bits, signed
    int16_t x;  // exactly 16 bits, signed
    int32_t y;  // exactly 32 bits, signed
    int64_t z;  // exactly 64 bits, signed

    uint8_t a; // exactly 8 bits, unsigned
    ...etc.
}
```
Similar to Java...

- variables
  - C99: don’t have to declare at start of a function or block
  - need not be initialized before use  
    (gcc -Wall will warn)

```c
#include <stdio.h>

int main(int argc, char **argv) {
    int x, y = 5;    // note x is uninitialized!
    long z = x+y;

    printf("z is '%ld'\n", z);  // what’s printed?
    {  
        int y = 10;
        printf("y is '%d'\n", y);
    }  

    int w = 20;   // ok in c99
    printf("y is '%d', w is '%d'\n", y, w);
    return 0;
}
```
Similar to Java...

`const`
- a qualifier that indicates the variable’s value cannot change
- compiler will issue an **error** if you try to violate this
- why is this qualifier useful?

```c
#include <stdio.h>

int main(int argc, char **argv) {
    const double MAX_GPA = 4.0;
    printf("MAX_GPA: %g\n", MAX_GPA);
    MAX_GPA = 5.0;  // illegal!
    return 0;
}
```
Similar to Java...

for loops
- C99: can declare variables in the loop header

if/else, while, and do/while loops
- C99: **bool** type supported, with `#include <stdbool.h>`
- any type can be used; 0 means **false**, everything else **true**

```c
int i;
for (i = 0; i < 100; i++) {
    if (i % 10 == 0) {
        printf("i: %d\n", i);
    }
}
```
Similar to Java...

parameters / return value

- C always passes arguments by value

  “pointers”
  
  ‣ lets you pass by reference
  ‣ more on these soon
  ‣ least intuitive part of C
  ‣ very dangerous part of C

```c
void add_pbv(int c) {
    c += 10;
    printf("pbv c: %d\n", c);
}

void add_pbr(int *c) {
    *c += 10;
    printf("pbr *c: %d\n", *c);
}

int main(int argc, char **argv) {
    int x = 1;
    printf("x: %d\n", x);
    add_pbv(x);
    printf("x: %d\n", x);
    add_pbr(&x);
    printf("x: %d\n", x);
    return 0;
}
```
Very different than Java

- just a bare, contiguous block of memory of the correct size
- an array of 10 ints requires $10 \times 4$ bytes = 40 bytes of memory
- arrays have no methods, do not know their own length
- C doesn’t stop you from overstepping the end of an array!!
- many, many security bugs come from this
Very different than Java strings
- array of char
- terminated by the NULL character ‘\0’
- are not objects, have no methods; string.h has helpful utilities

\[ char *x = "hello\n"; \]
Very different than Java

errors and exceptions
- C has no exceptions (no try / catch)
- errors are returned as integer error codes from functions
- makes error handling ugly and inelegant

crashes
- if you do something bad, you’ll end up spraying bytes around memory, hopefully causing a “segmentation fault” and crash

objects
- there aren’t any; struct is closest feature (set of fields)
Very different than Java memory management

- you must to worry about this; there is no garbage collector
  - local variables are allocated off of the stack
    ‣ freed when you return from the function
  - global and static variables are allocated in a data segment
    ‣ are freed when your program exits
- you can allocate memory in the heap segment using malloc()
  ‣ you must free malloc’ed memory with free()
  ‣ failing to free is a leak, double-freeing is an error (hopefully crash)
Very different than Java

Libraries you can count on

- C has very few compared to most other languages
- no built-in trees, hash tables, linked lists, sort, etc.
- you have to write many things on your own
  - particularly data structures
  - error prone, tedious, hard to build efficiently and portably
- this is one of the main reasons C is a much less productive language than Java, C++, python, or others
For Wednesday

Homework #0 is due:
- http://www.cs.washington.edu/education/courses/cse333/12au/assignments/hw0/hw0.html

Exercise 0 is due:
- http://www.cs.washington.edu/education/courses/cse333/12au/exercises/ex0.html
See you on Wednesday!
