CSE 333
Lecture 2 - arrays, memory, pointers

Hal Perkins
Department of Computer Science & Engineering
University of Washington
Administrivia

ex0, was due 30 minutes ago!
- let us know if you had any logistical issues with it

ex1 is out today, due on Friday

hw0 out today, due by end of weekend
- Primarily logistics and infrastructure - should be quick

hw1 out by weekend (sooner if we can do it)
- Due two weeks later - first (large) part of (larger) project

Reference system (grading, etc.) is CSE lab/VM Linux
Administrivia

Communications

- Use discussion board when possible
  - Contribute & read - help each other out
  - Everyone should must post a followup to the “welcome” message
    - get gopost to track new messages for you
- Mail to cse333-staff@cs when needed (not individual staff)

Office hours

- Doodle posted later today - please fill in
- Do we need temp hours this week?
Today’s agenda

More C details

- functions
- arrays
- refresher on C’s memory model
  - address spaces
  - the stack
  - brief reminder of pointers
Defining a function

```c
returnType name(type name, ..., type name) {
    statements;
}
```

```c
// sum integers from 1 to max
int sumTo(int max) {
    int i, sum = 0;

    for (i=1; i<=max; i++) {
        sum += i;
    }
    return sum;
}
```
Problem: ordering

You shouldn’t call a function that hasn’t been declared yet

```c
#include <stdio.h>

int main(int argc, char **argv) {
    printf("sumTo(5) is: %d\n", sumTo(5));
    return 0;
}

// sum integers from 1 to max
int sumTo(int max) {
    int i, sum = 0;
    for (i=1; i<=max; i++) {
        sum += i;
    }
    return sum;
}
```

sum_badorder.c
Problem: ordering

Solution 1: reverse order of definition

```c
#include <stdio.h>

// sum integers from 1 to max
int sumTo(int max) {
    int i, sum = 0;

    for (i=1; i<=max; i++) {
        sum += i;
    }
    return sum;
}

int main(int argc, char **argv) {
    printf("sumTo(5) is: %d\n", sumTo(5));
    return 0;
}
```
Problem: ordering

Solution 2: provide a declaration of the function

- teaches the compiler the argument and return types of the function
- then definitions can be in a logical order, not who-calls-what

```c
#include <stdio.h>

// this function prototype is
// a declaration of sumTo
int sumTo(int);

int main(int argc, char **argv) {
    printf("sumTo(5) is: %d\n", sumTo(5));
    return 0;
}

// sum integers from 1 to max
int sumTo(int max) {
    int i, sum = 0;
    for (i=1; i<=max; i++) {
        sum += i;
    }
    return sum;
}

sum_declared.c
```
Declaration vs Definition

C/C++ make a careful distinction between these

Definition: The thing itself

- Code for function, or a global variable definition that creates storage
- Must be **exactly one** actual definition of each thing (no dupes)

Declaration: Description of a thing in files that wish to use it

- Function prototype or external variable declaration
- Should be repeated in every source file that uses it
  - Often in header files and incorporated via `#include`
  - `#include` declaration in file that defines it to check consistency
Arrays

`type name[size];`

example allocates 100 ints’ worth of memory

- initially, each array element contains garbage data

an array does not know its own size

- `sizeof(scores)` is not reliable; only works in some situations

- recent versions of C allow the array size to be an expression

```c
int n=100;
int scores[n];  // OK in C99
```
Initializing and using arrays

type name[size] = {value, value, ..., value};
- allocates and array and fills it with supplied values
- if fewer values are given than the array size, fills rest with 0

name[index] = expression;
- sets the value of an array element

int primes[6] = {2, 3, 5, 6, 11, 13};
primes[3] = 7;
primes[100] = 0;    // smash!

// 1000 zeroes
int allZeroes[1000] = {0};
Multi-dimensional arrays

type name[rows][columns] = {{values}, ..., {values}};

- allocates a 2D array and fills it with predefined values

// a 2 row, 3 column array of doubles
double grid[2][3];

// a 3 row, 5 column array of ints
int matrix[3][5] = {
    {0, 1, 2, 3, 4},
    {0, 2, 4, 6, 8},
    {1, 3, 5, 7, 9}
};

matrix.c
Arrays as parameters

It’s tricky to use arrays as parameters

- arrays are effectively passed by reference (not copied)
- arrays do not know their own size

```c
int sumAll(int a[]);  // prototype declaration

int main(int argc, char **argv) {
    int numbers[5] = {3, 4, 1, 7, 4};
    int sum = sumAll(numbers);
    return 0;
}

int sumAll(int a[]) {
    int i, sum = 0;
    for (i = 0; i < ...???
}
Arrays as parameters

Solution 1: declare the array size in the function

- problem: code isn’t very flexible

```c
int sumAll(int a[5]);

int main(int argc, char **argv) {
    int numbers[5] = {3, 4, 1, 7, 4};
    int sum = sumAll(numbers);
    printf("sum is: %d\n", sum);
    return 0;
}

int sumAll(int a[5]) {
    int i, sum = 0;

    for (i = 0; i < 5; i++) {
        sum += a[i];
    }
    return sum;
}
```
Arrays as parameters

Solution 2: pass the size as a parameter

```c
int sumAll(int a[], int size);

int main(int argc, char **argv) {
    int numbers[5] = {3, 4, 1, 7, 4};
    int sum = sumAll(numbers, 5);
    printf("sum is: %d\n", sum);
    return 0;
}

int sumAll(int a[], int size) {
    int i, sum = 0;
    for (i = 0; i <= size; i++) {  // CAN YOU SPOT THE BUG?
        sum += a[i];
    }
    return sum;
}
```

arraysum.c
Returning an array

Local variables, including arrays, are stack allocated

- they disappear when a function returns
- therefore, local arrays can’t be safely returned from functions

```c
int *copyarray(int src[], int size) {
    int i, dst[size];       // OK in C99

    for (i = 0; i < size; i++) {
        dst[i] = src[i];
    }

    return dst;          // no -- buggy
}
```

buggy_copyarray.c
Solution: an output parameter

Create the “returned” array in the caller

- pass it as an **output parameter** to `copyarray`
- works because arrays are effectively passed by reference

```c
void copyarray(int src[], int dst[], int size) {
    int i;

    for (i = 0; i < size; i++) {
        dst[i] = src[i];
    }
}
```

copyarray.c
OS and processes

The OS lets you run multiple applications at once

- an application runs within an OS “process”
- the OS timeslices each CPU between runnable processes
  - happens very fast; ~100 times per second!

```
process 1       process 2       ...       process N
```

-------------------------------

operating system
Processes and virtual memory

OS gives each process the illusion of its own, private memory

- this is called the process’ *address space*

- contains the process’ virtual memory, visible only to it

- $2^{32}$ bytes on 32 bit host

- $2^{64}$ bytes on 64 bit host

contains code, data, libraries, stack, etc.
Loading

When the OS loads a program, it:

- creates an address space
- inspects the executable file to see what’s in it
- (lazily) copies regions of the file into the right place in the address space
- does any final linking, relocation, or other needed preparation
The stack

Used to store data associated with function calls

- when you call a function, compiler-inserted code will allocate a stack frame to store:
  - the function call arguments
  - the address to return to
  - local variables used by the function
  - a few other pieces of bookkeeping

```c
int f(int p1, int p2) {
    int x;
    int a[3];
    ...
    return x;
}
```

<table>
<thead>
<tr>
<th>offset</th>
<th>contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>24</td>
<td>p2</td>
</tr>
<tr>
<td>20</td>
<td>p1</td>
</tr>
<tr>
<td>16</td>
<td>return address</td>
</tr>
<tr>
<td>12</td>
<td>a[2]</td>
</tr>
<tr>
<td>8</td>
<td>a[1]</td>
</tr>
<tr>
<td>4</td>
<td>a[0]</td>
</tr>
<tr>
<td>0</td>
<td>x</td>
</tr>
</tbody>
</table>

a stack frame
The stack in action

```
int main(int argc, char **argv) {
    int n1 = f(3, -5);
    n1 = g(n1);
}

int f(int p1, int p2) {
    int x;
    int a[3];
    ...
    x = g(a[2]);
    return x;
}

int g(int param) {
    return param * 2;
}
```

- Read-only segment
  - (main, f, g)
Addresses and &

&foo produces the virtual address of foo

```c
#include <stdio.h>

int foo(int x) {
    return x+1;
}

int main(int argc, char **argv) {
    int x, y;
    int a[2];

    printf("x is at %p\n", &x);
    printf("y is at %p\n", &y);
    printf("a[0] is at %p\n", &a[0]);
    printf("a[1] is at %p\n", &a[1]);
    printf("foo is at %p\n", &foo);
    printf("main is at %p\n", &main);

    return 0;
}
```

Type *name; // declare a pointer
type *name = address; // declare + initialize a pointer

A pointer is a variable that contains a memory address
- it points to somewhere in the process’ virtual address space

```c
int main(int argc, char **argv) {
    int x = 42;
    int *p;  // p is a pointer to an integer
    p = &x;  // p now contains the address of x
    printf("x is \%d\n", x);
    printf("\&x is \%p\n", &x);
    printf("p is \%p\n", p);
    return 0;
}
```

A stylistic choice

C gives you flexibility in how you declare pointers

- one way can lead to visual trouble when declaring multiple pointers on a single line
  
  ```
  int* p1; int *p2; // i prefer
  ```

- the other way is what I prefer

  ```
  int* p1, *p2; // correct
  ```

  or

  ```
  int *p1, *p2; // correct - spaces around *s don’t matter
  ```
Dereferencing pointers

*pointer // dereference a pointer
*pointer = value; // dereference / assign

dereference: access the memory referred to by a pointer

```c
#include <stdio.h>

int main(int argc, char **argv) {
    int x = 42;
    int *p;  // p is a pointer to an integer
    p = &x;  // p now contains the address of x
    printf("x is %d\n", *p);
    p = &x;
    printf("x is %d\n", *p);
    return 0;
}
```

deref.c
Self exercise #1

Write a function that:

- accepts an array of 32-bit unsigned integers, and a length
- reverses the elements of the array in place
- returns void (nothing)
Self exercise #2

Write a function that:

- accepts a function pointer and an integer as an argument
- invokes the pointed-to function
  ‣ with the integer as its argument
Self exercise #3

Write a function that:

- accepts a string as a parameter
- returns
  - the first whitespace-separated word in the string (as a newly allocated string)
  - and, the size of that word
See you on Friday!
