Welcome!

Today’s goals:

- **introductions**
- **course syllabus**
- **quick C refresher**
Introductions

Us (cse333-staff@cs)
- Hal Perkins (Instructor)
- Sunjay Cauligi (TA)
- Cortney Corbin (TA)
- Renshu Gu
- JiJiang Yan

Most important: You!!
Welcome!

Today’s goals:

- introductions
- course syllabus
- quick C refresher
Course map: 100,000 foot view

- Hardware
  - CPU
  - Memory
  - Storage
  - Network
  - GPU
  - Clock
  - Audio
  - Radio
  - Peripherals

- OS / App Interface
  - System Calls

- Operating System
  - C application
  - C++ application
  - Java application
  - C standard library (glibc)
  - C++ STL / boost / standard library
  - JRE
Systems programming

The programming skills, engineering discipline, and knowledge you need to build a system

- **programming**: C / C++
- **discipline**: testing, debugging, performance analysis
- **knowledge**: long list of interesting topics
  - concurrency, OS interfaces and semantics, techniques for consistent data management, distributed systems algorithms, ...
  - most important: a deep understanding of the “layer below”
    - quiz: is data safely on disk after a “write( )” system call returns?
Discipline?!?

Cultivate good habits, encourage clean code
- coding style conventions
- unit testing, code coverage testing, regression testing
- documentation (code comments, design docs)
- code reviews

Will take you a lifetime to learn
- but oh-so-important, especially for systems code
  ‣ avoid write-once, read-never code
What you will be doing

Attending lectures and sections
  - lecture: ~27 of them, MWF here
  - sections: ~10 of them, Thu 8:30 (sorry), 9:30, 10:30, not here
  - Take notes!!!! Don’t expect everything to be on the web

Doing programming projects
  - 4 of them, successively building on each other, plus a warmup
  - includes C, C++; file system, network

Doing programming exercises
  - one per lecture, due before the next lecture begins
  - coarse-grained grading (0,1,2,3)

Midterm and a final exam (your instructor is a traditionalist)
Midterm Scheduling

Best date given our project timetable is Fri. Feb. 14

- But may conflict with other classes
- How many people are also taking CSE 341?
- How many in CSE 332? Which one (9:30? 12:30?)
- Other 10:30 or 12:30 classes? (particularly if it involves a long hike)
- Other classes with exams on Fri. Feb. 14?
  - What about Mon. Feb. 10?
Deadlines & Conduct

Need to get things done on time (very hard to catch up)

- Programming assignments: 4 late days, 2 max per project
- Exercises: no late days (max benefit that way)

Academic Integrity (details on the web; read them)

- I trust you implicitly; I will follow up if that trust is violated
- The rules boil down to: don’t attempt to gain credit for something you didn’t do, and don’t help others do so
- That does not mean suffer in silence - you have colleagues, instructor, TAs - work with them; learn from each other!
Course calendar

Linked off of the course web page

- master schedule for the class

- links to:
  - lecture slides
  - code discussed in lectures
  - assignments, exercises (including due dates)
  - optional “self-exercise” solutions
  - various C/C++/Linux resources
Welcome!

Today’s goals:
- *introductions*
- *course syllabus*
- *quick C refresher*
C

Created in 1972 by Dennis Ritchie
- designed for creating system software
- portable across machine architectures
- most recently updated in 1999 (C99) and 2011 (C11)

Characteristics
- low-level, smaller standard library than Java
- procedural (not object-oriented)
- typed but unsafe; incorrect programs can fail spectacularly
C workflow

source files (.c, .h)

object files (.o)

Editor (emacs, vi)       or IDE (eclipse)

edit

compile

foo.c

bar.c

execute, debug, profile,

...
From C to machine code

C source file
(dosum.c)

int dosum(int i, int j) {
    return i+j;
}

C compiler (gcc -S)

dosum:
    pushl %ebp
    movl %esp, %ebp
    movl 12(%ebp), %eax
    addl 8(%ebp), %eax
    popl %ebp
    ret

assembly source file
(dosum.s)

machine code
(dosum.o)

assembler (as)

CSE333 lec1 intro // 01-06-14 // perkins
Skipping assembly language

Most C compilers generate .o files (machine code) directly
- i.e., without actually saving the readable .s assembly file

```
 gcc -S dosum.c  →  dosum.s
           |         |         |
           v         |         v
             gcc -c  →  dosum.o
```

```
 gcc -c dosum.s  →  as dosum.o
           |         |         |
           v         |         v
             dosum.o →  dosum.o
```
Multi-file C programs

C source file (dosum.c)

```c
#include <stdio.h>

int dosum(int i, int j) {
    return i+j;
}
```

C source file (sumnum.c)

```c
int main(int argc, char **argv) {
    printf("%d\n", dosum(1,2));
    return 0;
}
```
Multi-file C programs

C source file (dosum.c)

```c
#include <stdio.h>

int dosum(int i, int j) {
    return i+j;
}
```

C source file (sumnum.c)

```c
int main(int argc, char **argv) {
    printf("%d\n", dosum(1,2));
    return 0;
}
```

why do we need this #include?

where is the implementation of printf?
Compiling multi-file programs

Multiple object files are **linked** to produce an executable
- standard libraries (libc, crt1, ...) are usually also linked in
- a library is just a pre-assembled collection of .o files

```
  dosum.c        gcc -c  dosum.o
      |         |           |
      v         v           |
sumnum.c   gcc -c  sumnum.o
             |         |                  |
             v         v      |
             libraries (e.g., libc)
```

ld (or gcc)  sumnum  libraries (e.g., libc)
Object files

sumnum.o, dosum.o are **object files**

- each contains machine code produced by the compiler
- each might contain references to external symbols
  - variables and functions not defined in the associated .c file
  - e.g., sumnum.o contains code that relies on printf( ) and dosum( ), but these are defined in libc.a and dosum.o, respectively
- linking resolves these external symbols while smooshing together object files and libraries
Let’s dive into C itself

Things that are the same as Java

- syntax for statements, control structures, function calls
- types: int, double, char, long, float
- type-casting syntax: float x = (float) 5 / 3;
- expressions, operators, precedence
  + - * / % ++ -- = += -= *= /= %= < <= == != > >= && || !
- scope (local scope is within a set of { } braces)
- comments: /* comment */ // comment
# Primitive types in C

**see sizeofs.c**

</table>

**integer types**
- char, int

**floating point**
- float, double

**modifiers**
- short [int]
- long [int, double]
- signed [char, int]
- unsigned [char, int]
C99 extended integer types

Solves the conundrum of “how big is a long int?”

```c
#include <stdint.h>

void foo(void) {
    int8_t w;       // exactly 8 bits, signed
    int16_t x;      // exactly 16 bits, signed
    int32_t y;      // exactly 32 bits, signed
    int64_t z;      // exactly 64 bits, signed

    uint8_t a;      // exactly 8 bits, unsigned
    ...etc.
}
```
Similar to Java...

- variables
  - C99: don’t have to declare at start of a function or block
  - need not be initialized before use  *(gcc -Wall will warn)*

```c
#include <stdio.h>

int main(int argc, char **argv) {
  int x, y = 5;  // note x is uninitialized!
  long z = x+y;

  printf("z is '%ld'\n", z);  // what’s printed?
  {
    int y = 10;
    printf("y is '%d'\n", y);
  }
  int w = 20;  // ok in c99
  printf("y is '%d', w is '%d'\n", y, w);
  return 0;
}
```
Similar to Java...

**const**
- a qualifier that indicates the variable’s value cannot change
- compiler will issue an **error** if you try to violate this
- why is this qualifier useful?

```c
#include <stdio.h>

int main(int argc, char **argv) {
    const double MAX_GPA = 4.0;

    printf("MAX_GPA: %g\n", MAX_GPA);
    MAX_GPA = 5.0; // illegal!
    return 0;
}
```
Similar to Java...

for loops
- C99: can declare variables in the loop header

if/else, while, and do/while loops
- C99: `bool` type supported, with `#include <stdbool.h>`
- any type can be used; 0 means `false`, everything else `true`

```c
int i;
for (i = 0; i < 100; i++) {
    if (i % 10 == 0) {
        printf("i: %d\n", i);
    }
}
```

loopy.c
Similar to Java...

parameters / return value

- C always passes arguments by value
- “pointers”
  ‣ lets you pass by reference
  ‣ more on these soon
  ‣ least intuitive part of C
  ‣ very dangerous part of C

```c
void add_pbv(int c) {
    c += 10;
    printf("pbv c: %d\n", c);
}

void add_pbr(int *c) {
    *c += 10;
    printf("pbr *c: %d\n", *c);
}

int main(int argc, char **argv) {
    int x = 1;
    printf("x: %d\n", x);
    add_pbv(x);
    printf("x: %d\n", x);
    add_pbr(&x);
    printf("x: %d\n", x);
    return 0;
}
```
Very different than Java

arrays

- just a bare, contiguous block of memory of the correct size
- an array of 10 ints requires $10 \times 4$ bytes = 40 bytes of memory
arrays have no methods, do not know their own length
- C doesn’t stop you from overstepping the end of an array!!
- many, many security bugs come from this
Very different than Java

strings
- array of char
- terminated by the NULL character ‘\0’
- are not objects, have no methods; string.h has helpful utilities

```c
char *x = "hello\n";
```
Very different than Java

errors and exceptions

- C has no exceptions (no try / catch)
- errors are returned as integer error codes from functions
- makes error handling ugly and inelegant

crashes

- if you do something bad, you’ll end up spraying bytes around memory, hopefully causing a “segmentation fault” and crash

objects

- there aren’t any; struct is closest feature (set of fields)
Very different than Java

memory management

- **you** must to worry about this; there is no garbage collector
- local variables are allocated off of the stack
  ‣ freed when you return from the function
- global and static variables are allocated in a data segment
  ‣ are freed when your program exits
- you can allocate memory in the heap segment using `malloc()`
  ‣ you must free `malloc`ed memory with `free()`
  ‣ failing to free is a leak, double-freeing is an error (hopefully crash)
Very different than Java

Libraries you can count on

- C has very few compared to most other languages
- no built-in trees, hash tables, linked lists, sort, etc.
- you have to write many things on your own
  - particularly data structures
  - error prone, tedious, hard to build efficiently and portably
- this is one of the main reasons C is a much less productive language than Java, C++, python, or others
For Wednesday

Exercise 0 is due:

- (Easier: look on the calendar or homework page for the link)

Post a message on the discussion board

- Get it to keep track of new messages for you!

Fill out the office hours doodle - help us pick good times

Homework 0 out before class Wednesday

- Mostly logistics (get files, fiddle with files, turn in files)

- Watch for email to course mailing list (and you are already subscribed if you are enrolled)
See you on Wednesday!
