CSE 333
Lecture 18 -- server sockets

Hal Perkins
Department of Computer Science & Engineering
University of Washington
Administrivia

Exercise covering client-side programming posted late yesterday, due Monday before class

Next exercise covers today’s server-side code. Post today or wait until Monday? (Due Wed. in either case)

HW4 out after class, due last Wednesday of the quarter (+ late days if you have them)
Today

Network programming

server-side programming
Servers

Pretty similar to clients, but with additional steps

there are seven steps:

figure out the address and port on which to listen

create a socket

**bind** the socket to the address and port on which to listen

indicate that the socket is a **listening** socket

**accept** a connection from a client

**read** and **write** to that connection

**close** the connection
Accepting a connection from a client

Step 1. Figure out the address and port on which to listen.

Step 2. Create a socket.

Step 3. **Bind** the socket to the address and port on which to listen.

Step 4. Indicate that the socket is a **listening** socket.
Servers

Servers can have multiple IP addresses

“multihomed”

usually have at least one externally visible IP address, as well as a local-only address (127.0.0.1)

When you bind a socket for listening, you can:

specify that it should listen on all addresses

by specifying the address “INADDR_ANY” or “in6addr_any” -- 0.0.0.0 or :: (i.e., all 0’s)

specify that it should listen on a particular address
The “bind( )” system call associates with a socket:

- an address family
  - `AF_INET`: IPv4
  - `AF_INET6`: IPv6 (also handles IPv4 clients on POSIX systems)

- a local IP address
  - the special IP address `INADDR_ANY` ("0.0.0.0") means "all local IPv4 addresses of this host"
    - use `in6addr_any` (instead of `INADDR_ANY`) for IPv6

- a local port number
listen()

The “listen()” system call tells the OS that the socket is a listening socket to which clients can connect

you also tell the OS how many pending connections it should queue before it starts to refuse new connections

you pick up a pending connection with “accept()”

when listen returns, remote clients can start connecting to your listening socket

you need to “accept()” those connections to start using them
Server socket, bind, listen

see server_bind_listen.cc
Accepting a connection from a client

Step 5. `accept()` a connection from a client.

Step 6. `read()` and `write()` to the client.

Step 7. `close()` the connection.
accept( )

The “accept( )” system call waits for an incoming connection, or pulls one off the pending queue

it returns an active, ready-to-use socket file descriptor connected to a client

it returns address information about the peer

use inet_ntop( ) to get the client’s printable IP address

use getnameinfo( ) to do a reverse DNS lookup on the client
Server accept, read/write, close

see server_accept_rw_close.cc
Something to note...

Our server code is not concurrent

- single thread of execution
- the thread blocks waiting for the next connection
- the thread blocks waiting for the next message from the connection

A crowd of clients is, by nature, concurrent

- while our server is handling the next client, all other clients are stuck waiting for it
Before we go...

hw4 demo
Exercise 1

Write a program that:

- creates a listening socket, accepts connections from clients
- reads a line of text from the client
- parses the line of text as a DNS name
- does a DNS lookup on the name
- writes back to the client the list of IP addresses associated with the DNS name
- closes the connection to the client
Exercise 2

Write a program that:

- creates a listening socket, accepts connections from clients
- reads a line of text from the client
- parses the line of text as a DNS name
- connects to that DNS name on port 80
- writes a valid HTTP request for "/
- see next slide for what to write
- reads the reply, returns the reply to the client
Exercise 2 continued

Here’s a valid HTTP request to server www.foo.com

note that lines end with ‘\r\n’, not just ‘\n’

```
GET / HTTP/1.0\r\nHost: www.foo.com\r\nConnection: close\r\n\r\n```

CSE333 lec 18 networks.3 // 08-07-15 // Perkins
See you on Wednesday!
