

# CSE 341: Programming Languages

## Course Information and Syllabus

### Winter 2008

**Logistics and Contact Information:** The instructor is Dan Grossman. See the course homepage ([www.cs.washington.edu/education/courses/cse341/08wi](http://www.cs.washington.edu/education/courses/cse341/08wi)) for information regarding teaching assistants, office hours, sections, etc. *You must ensure your email settings are correct for receiving course email-list messages, and you should check email at least daily.*

**Goals:** Successful course participants will:

- Internalize an accurate understanding of what functional and object-oriented programs mean
- Develop the skills necessary to learn new programming languages quickly
- Master specific language concepts such that they can recognize them in strange guises
- Learn to evaluate the power and elegance of programming languages and their constructs
- Attain reasonable proficiency in ML, Scheme, and Ruby
- As a by-product, become more proficient in languages they already know

**Grading and Exams:** Do not miss the midterm or final.

Midterm	20%	Friday February 8, in class
Final	25%	Wednesday March 19, <b>8:30-10:20</b>
Homeworks	55%	approximately weekly (probably 7 total)

*Unless announced otherwise, all homeworks contribute equally to the 55%.*

**Late Policy:** Homework is due at **8:00AM** on the due date (so you will typically submit it the night before). This deadline is strict, so it is exceedingly unlikely that skipping class or arriving late to do homework is in your interest. For the entire quarter, you have **3** “late days”. You are strongly advised to save them for emergencies. You may use at most 2 for the same assignment. They must be used in 24-hour chunks.

**Academic Integrity:** Any attempt to misrepresent the work you did will be dealt with via the appropriate University mechanisms, and your instructor will make every attempt to ensure the harshest allowable penalty. The guidelines for this course and more information about academic integrity are in a separate document. *You are responsible for knowing the information in that document.*

**Text:** The “required” text is: “Jeffrey D. Ullman. Elements of ML Programming, ML’97 Edition. 1998.” We will not follow the text closely, but it will likely prove useful during the first few weeks. The “recommended” text is: “Dave Thomas. Programming with Ruby. 2005.” We will cover only material that overlaps with several chapters of this large book. You must decide how much you benefit from having a book in your hand; there are also many free on-line resources. There is no specific book for the Scheme portion of the course.

**Advice:**

- In every course, there is a danger that you will not learn much and thus lose the most important reason to take the course. In 341, this danger is severe because it is easy to get “distracted by unfamiliar surroundings” and never focus on the concepts you need to learn. These surroundings include new syntax, editors, error messages, etc. Becoming comfortable with them is *only one* aspect of this course, so you must get past it. When we use a new language, you must spend time on your own “getting comfortable” in the new setting as quickly as possible so you do not start ignoring the course material.
- If you approach the course by saying, “I will have fun learning to think in new ways” then you will do well. If you instead say, “I will try to fit everything I see into the way I already look at programming” then you will get frustrated. By the end, it will relate back to what you know, but be patient.
- Your instructor aims for lecture and section to be some of the most enriching hours of your college career. We will start promptly, and you should arrive punctually and well-rested. Neither you nor the instructor chose the 9:30 time, but you may wish to adjust your sleep schedule accordingly.

## Approximate Topic List (Subject to Change):

1. Syntax vs. semantics vs. idioms vs. libraries vs. tools
2. ML basics (bindings, conditionals, records, functions)
3. Recursive functions and recursive types
4. Algebraic datatypes, pattern matching
5. Higher-order functions; closures
6. Lexical vs. dynamic scope
7. Currying
8. Syntactic sugar
9. Equivalence and effects
10. Parametric polymorphism and container types
11. Type inference
12. Abstract types and modules
13. Scheme basics
14. Dynamic vs. static typing
15. Laziness and memoization
16. Implementing higher-order functions
17. Continuation-passing idioms
18. Macros
19. Abstract types via dynamic type-creation
20. Ruby basics
21. Object-oriented programming is dynamic dispatch
22. Pure object-orientation
23. Implementing dynamic dispatch
24. Subtyping for records, functions, and objects
25. Class-based subtyping
26. Fragile superclasses, multiple inheritance
27. Unexpected change via subclassing
28. Multimethods vs. static overloading
29. Subtyping vs. parametric polymorphism
30. Functional vs. OO extensibility
31. Basic garbage-collection implementation

To learn these concepts using real programming languages and to gain experience with different languages, we will use:

- Standard ML (a statically typed, mostly functional language) (approximately 4–5 weeks)
- Scheme (a dynamically typed, mostly functional language) (approximately 2–3 weeks)
- Ruby (a dynamically typed, object-oriented language) (approximately 2 weeks)
- Java (a statically typed, object-oriented language) (less than 1 week)

There are thousands of languages not on this list, many programming paradigms not represented, and many language constructs and concepts that it would be great to study.
