

CSE373: Data Structures \& Algorithms

## Lecture 24: The P vs. NP question, NP-Completeness

Catie Baker<br>Spring 2015

## Admin

- Homework 5 due TONIGHT at 11pm!
- Homework 6 is posted
- Due one week from today, June $3^{\text {rd }}$ at 11 pm
- No partners

## The $\$ 1 \mathrm{M}$ question

The Clay Mathematics Institute Millenium Prize Problems

1. Birch and Swinnerton-Dyer Conjecture
2. Hodge Conjecture
3. Navier-Stokes Equations
4. P vs NP
5. Poincaré Conjecture
6. Riemann Hypothesis
7. Yang-Mills Theory

## The P versus NP problem

Is one of the biggest open problems in computer science (and mathematics) today

It's currently unknown whether there exist polynomial time algorithms for NP-complete problems

- That is, does $\mathrm{P}=\mathrm{NP}$ ?
- People generally believe $P \neq N P$, but no proof yet

But what is the P-NP problem?

## Sudoku

| 2 |  |  | 3 |  | 8 |  | 5 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | 3 |  | 4 | 5 | 9 | 8 |  |
|  |  | 8 |  |  | 9 | 7 | 3 | 4 |
| 6 |  | 7 |  | 9 |  |  |  |  |

## Sudoku

## P vs NP problem

## $=$

Does there exist an algorithm for solving $n \times n \times n$ Sudoku that runs in time $p(n)$ for some polynomial $p()$ ?

## The P versus NP problem (informally)

Is finding an answer to a problem much more difficult than verifying an answer to a problem?

## Hamilton Cycle

Given a graph $G=(V, E)$, is there a cycle that visits all the nodes exactly once?

YES if $G$ has a Hamilton cycle NO if $G$ has no Hamilton cycle

The Set "HAM"

HAM $=\{$ graph $G \mid G$ has a Hamilton cycle $\}$

## Circuit-Satisfiability

Input: A circuit C with one output
Output: YES if C is satisfiable
NO if $C$ is not satisfiable

## The Set "SAT"

SAT $=\{$ all satisfiable circuits $C$ \}

## Sudoku

Input: $\mathrm{n} \times \mathrm{n} \times \mathrm{n}$ sudoku instance
Output: YES if this sudoku has a solution NO if it does not

## The Set "SUDOKU"

SUDOKU $=\{$ All solvable sudoku instances $\}$

## Polynomial Time and The Class " $P$ "

## What is an efficient algorithm?

Is an $O(n)$ algorithm efficient?
How about $O(n \log n)$ ?
$\mathrm{O}\left(\mathrm{n}^{2}\right)$ ?
$\mathrm{O}\left(\mathrm{n}^{10}\right)$ ?
$O\left(n^{\log n}\right) ?$
$O\left(2^{n}\right) ?$
$\mathrm{O}(\mathrm{n}!)$ ?

## What is an efficient algorithm?

Does an algorithm running in $\mathrm{O}\left(\mathrm{n}^{100}\right)$ time count as efficient?

Asking for a poly-time algorithm for a problem sets a (very) low bar when asking for efficient algorithms.

We consider non-polynomial time algorithms to be inefficient.

And hence a necessary condition for an algorithm to be efficient is that it should run in poly-time.

## The Class P

The class of all sets that can be verified in polynomial time.

## AND

The class of all decision problems that can be decided in polynomial time.

Binary Search

Dijkstra's Algorithm

Breadth-First Search

Sorting Algorithms

## The question is: can we achieve even this for

## HAM? <br> SAT? <br> Sudoku?

## Onto the new class, NP

## (Nondeterministic Polynomial Time)

## Verifying Membership

Is there a short "proof" I can give you to verify that:
$G \in H A M ?$
$G \in$ Sudoku?
$G \in S A T ?$

Yes: I can just give you the cycle, solution, circuit

## The Class NP

The class of sets for which there exist "short" proofs of membership (of polynomial length) that can "quickly" verified (in polynomial time).

Fact: $\mathrm{P} \subseteq \mathrm{NP}$

Recall: The algorithm doesn't have to find the proof; it just needs to be able to verify that it is a "correct" proof.

## $\mathrm{P} \subseteq \mathrm{NP}$

## Hamilton Cycle

## Sudoku

## Summary: P versus NP

NP: "proof of membership" in a set can be verified in polynomial time.

P : in NP (membership verified in polynomial time)
AND membership in a set can be decided in polynomial time.

Fact: $P \subseteq N P$
Question: Does NP $\subseteq P$ ?
i.e. Does $P=N P$ ?

People generally believe $P \neq$ NP, but no proof yet

## Why Care?

## NP Contains Lots of Problems We Don't Know to be in P

Classroom Scheduling
Packing objects into bins
Scheduling jobs on machines
Finding cheap tours visiting a subset of cities
Finding good packet routings in networks
Decryption

OK, OK, I care...

## How could we prove that NP = P?

We would have to show that every set in NP has a polynomial time algorithm...

How do I do that?
It may take a long time!
Also, what if I forgot one of the sets in NP?

## How could we prove that NP = P?

We can describe just one problem Lin NP, such that if this problem $L$ is in $P$, then $N P \subseteq P$.

It is a problem that can capture all other problems in NP.
The "Hardest" Set in NP
We call these problems NP-complete

## Theorem [Cook/Levin]

SAT is one problem in NP, such that if we can show SAT is in $P$, then we have shown $N P=P$.

SAT is a problem in NP that can capture all other languages in NP.

We say SAT is NP-complete.

## Poly-time reducible to each other

## NP-complete: The "Hardest" problems in NP

## Sudoku Clique

SAT
Independent-Set
3-Colorability HAM
These problems are all "polynomial-time equivalent" i.e., each of these can be reduced to any of the others in polynomial time

If you get a polynomial-time algorithm for one, you get a polynomial-time algorithm for ALL. (you get millions of dollars, you solve decryption, ... etc.)
