Welcome!

• We have 10 weeks to move to a level well above novice programmer:
  – Command-line tools/scripts to automate tasks
  – C programming (lower level than Java; higher than assembly)
  – Tools for programming
  – Basic software-engineering concepts
  – Basics of concurrency
• That’s a lot!
• Get used to exposure, not exhaustive investigation
  – This is not intro programming anymore
Today

- In class today
  - Course mechanics
  - Overview and plan
  - Dive into the command shell

- By next time
  - Get going on homework 0
    - Due Friday night!!
    - Goal: Get a login shell on your Linux machine (probably CSE VM) so you’re ready to go!
  - Start reading Linux Pocket Guide (pp. 1-33 for sure; skim later sections looking for interesting things)
Who

• Staff
  – Hal Perkins, instructor, perkins@cs, CSE 548
  – Tamara Bonaci, TA, tbonaci@cs
  – Soumya Vasisht, TA, vasisht@cs

• You!
  – Over 65 people(!)
  – Who has used Linux before?
  – Who has written a C program before?
    • Beyond hello world?
If you’re trying to add the course…

- Watch for positions to open up in the next couple of days as people adjust their schedules.
- If the number is manageable, we’ll collect names Friday and see what we might be able to do.
What

• 3 classes/week (slides, code, demos, questions)
  – Material online (often after class), but **TAKE NOTES**!
  – Advice: jot down keywords and ideas; look up details later
  – Advice: use class for concepts (you can do *this*); use documentation for details (*how*)
  – Advice: experiment, try things later that day
  – Warning: the slides are **not nearly enough** to learn everything you need. They are an outline, tour guide, orientation only.
Requirements

- 7 homeworks (+ / - 1) (50%)
  - 3 shell commands and scripting
  - 3 C programming
    - Later two of these use tools extensively
    - One is a team project (work in pairs)
  - 1 C++ programming
- 1 midterm (20%), 1 final (25%)
- Last 5% is citizenship, participation, etc.
- Collaboration: individual work unless announced otherwise; never look at or show your code to others
- Extra credit: when available, small effect on your grade if you do it – no effect if you don’t
Academic Integrity

• Policy on the course web. Read it!
• Do your own work – always explain any unconventional action on your part
• I trust you completely
• I have no sympathy for trust violations – nor should you
• Honest work is the most important feature of a university. It shows respect for your colleagues and yourself.
Deadlines

- Turn things in on time!
- But things happen, so …
  - You have 4 late days to use this quarter
  - No more than 2 late days per assignment
  - Counted in 24 hour chunks (5 min = 24 hours late)
  - On group projects, can only use if both partners have late days and both partners are charged
- That’s it. No other extensions (but contact instructor if you are hospitalized)
- Advice: Save late days for the end of quarter when you (might) really need them
What to Expect

• Assignments may be less structured than you’re used to
  – “Write a program that does this”
    • You need to figure out if you’re getting the right output
    • Usually no “sample solution” to compare with
  – Learning how to deal with this is part of the plan
• Learning how to learn things is part of the plan
  – Learn your way around man pages, books, online documents (Google *is* your friend – but only one of them)
  – But *don’t* just cut-n-paste code to “get it to work”
    • You *must* understand why your code does what it does, and be able to explain it!
• Tinker – try things. Write toy programs
  – The course is *much* harder if you only do the assigned work
  – *Don’t* avoid learning new tools
Resources – Books

- Linux Pocket Guide: Enough Linux for CSE 374 and well beyond (you should have this)
- *C Programming Language* (K&R) – The classic Good for C & programming philosophy, examples + concise language & library reference (optional)
- Others: O’Reilly publishes good books on many specific topics. Free online access via UW library (Safari Books Online; includes O’Reilly) Safari includes other good tech publishers/books.
So What is CSE 374?

• Relatively new course
  – Most material taken from CSE 303 (particularly slides by Dan Grossman, but whatever else I can steal)
• Something of a “laundry list of everything else”, but…
  There is an amorphous set of things computer scientists know about and novice programmers don’t. Knowing them empowers you in computing, lessens the “friction” of learning in other classes, and makes you a mature programmer.
• The goal is to give you a sense of what’s out there and what you can expect – and how you can learn more later when you need to
5 General Areas

1. The command line
   – Text-based manipulation of the computing environment
   – Automating (scripting) this manipulation
   – Using powerful utility programs

• Let the computer do what it’s good at so you don’t have to!
• We’ll use Linux (an operating system) and bash (a shell)
  – but the concepts are not tied to these
• Idea: Knowing the name of what “ought to exist”
• Idea: Programming in a language designed for interaction
2. C (and a little C++)
   – “The” programming language for operating systems, networking, embedded devices, ...
   – Manual resource management
   – Trust the programmer: a “correct” C implementation will run a program with an array-bounds error and whatever happens, happens
   – A “lower level” view of programming: all code and data sits together in a “big array of bits”
   
   • Idea: Parts look like Java – don’t let that deceive you!
   • Idea: Learn to think before you write, and test often
5 General Areas

3. Programming tools – so far you have written programs and run them. There are programs for programming you should know about:
   – Compilers (vs interpreters)
   – Debuggers
   – Linkers
   – Recompilation managers
   – Version-control systems
   – Profilers
   – …
5 General Areas

4. Software development concepts – what do you need to know to write a million lines of code*?
   – Testing strategies
   – Team-programming concepts
   – Software specifications and their limits
   – …

*No, you will not write a million lines of code for CSE 374 this quarter, although it may seem like it at times…
5 General Areas

5. Basics of concurrency – what happens when more than one thing can happen at once in a program?
   - Brand-new kinds of bugs (e.g., races)
   - Approaches to synchronization
   - And it matters – most computers you can buy have (at least) 2 processors; that will be 16+ in a year or two
     • How do we run enough stuff concurrently to keep all the processors busy?
Perspective

“There is more to programming than Java methods”
“There is more to software development than programming”
“There is more to computer science than software development”

So let’s get started...
The O/S, the Filesystem, the Shell

• Some things you might have a sense of but never were told precisely (may as well start at the beginning) . . .
• The file-system is a tree
  – (Actually it’s a dag)
  – The top is /
  – Interior nodes are directories (displayed as folders in GUls)
• Users log-in, which for Linux means getting a shell
  – They have permissions to access certain files/directories
  – They have a “home directory” somewhere in the file-system
  – They can run programs. A running program is a process. (Actually could be more than one.)
• We’re somewhat* agnostic about what you use
  – Needs to be a fairly recent Linux distribution with standard tools, bash shell, gcc, utilities (Ubuntu, Fedora, others…)
  – Mac OS X developer tools has what you need
  – But we’ve got a better idea…

*but not completely – what you turn in has to work on our test machines!
Free CSE Linux (virtual) Machines!

• CSE Linux virtual machine
  – 64-bit Fedora 15 with CSE configuration
  – Runs on Mac, Windows, even other Linux(!)
  – Need VMware Player (free, Windows or Linux host) or VMware Fusion (~$50 at bookstore, Mac)
  – Download ~6-8 GB – grab it at UW and put it on your laptop or a thumb drive to take home
  – CSE 374 web has links to details

• This is our reference system; we’ll evaluate assignments here
UW CSE Linux Virtual Machine

- Startup
- Configure user account name and user/superuser passwords
- Shell window

Demo
File Manipulation

- You may be used to manipulating files via a GUI using WIMP
- You can do all the same things by running programs in the shell
- Just like an “explorer window”, the shell has a current working directory
- It really helps to remember the names of key commands: ls, cp, mv, rm, cat, cd, pwd.
  - (Most are really just programs.)
- Current directory: .
- Parent directory: ..
- Relative vs. absolute pathnames
What?

• Why would anyone want to interact like this?
  – Old people who remember life before GUIs :-)
  – Power users who can go faster
  – Users who want easy logging
  – Users who want easy instructions
  – Users who want programmability (scripting!)

• The last one will be the core of the first assignments
• Most computer scientists use GUIs and shells, depending what they’re doing.
• Linux has GUIs and Windows has shells
Options, man (and info)

- Bad news for new Linux users:
  - Program names and options are short, arcane, and numerous
- Good news
  - Most programs print a *usage* argument if given bad options (or often implement `-help` or `--help`)
  - The command `man what` prints a file describing program `what`
    - Also: `info what` for complex programs (bash, gcc, some others)
  - Tons of other resources (e.g., Linux Pocket Guide; the web – google is your friend)
  - Things are somewhat standardized (dashes for options followed by argument as needed)
A Few More Programs and Options

- less (is more)
  - used by man
  - spacebar, b, /search-exp, q
- chmod
- mail

And some that aren’t technically programs (more on this later)
- exit
- echo
- (cd)
Work to do!

• Get started on homework 0 *now!*
  – Due Friday
  – This means get your Linux setup working *today* (well, ok, maybe tomorrow – but *not Friday!*)
  – Includes preference doodle for office hours – fill out

• Start reading the Pocket Guide
  – Pp. 1-32, the skim through later sections
  – Don’t memorize stuff – try it!
  – Get an idea of what’s possible and where to look

• If you’re still trying to enroll, put your name on the signup sheet
