CSE 401 – Compilers

Overview and Administrivia
Hal Perkins
Autumn 2011
Credits

- Some direct ancestors of this quarter:
  - UW CSE 401 (Chambers, Snyder, Notkin...)
  - UW CSE PMP 582/501 (Perkins)
  - Cornell CS 412-3 (Teitelbaum, Perkins)
  - Rice CS 412 (Cooper, Kennedy, Torczon)
  - Many books (Appel; Cooper/Torczon; Aho, [[Lam,] Sethi,] Ullman [Dragon Book], Fischer, Cytron, LeBlanc; Muchnick, ...)

Agenda

- Introductions
- Administrivia
- What’s a compiler?
- Why you want to take this course
- & a little history if time
CSE 401 Personnel

- Instructor: Hal Perkins
  - CSE 548; perkins[at]cs
  - Office hours: tbd + dropins, etc.
- TAs: Sam Fout, Evan Herbst
  - Office hours, etc. tbd.

- You!!!
So whadda ya know?

- The revenge of the new core curriculum
- Official prereq: (326 & 378) \(\lor\) (332 & 351)
  - E.g., data structures and machine organization
- Who took what?
  - CSE 321/322 vs CSE 311/312
  - CSE 326 vs CSE 332
  - CSE 378 vs CSE 351
  - CSE 341 (now optional)
Course Meetings

- Lectures
  - MWF 12:30-1:20 here (More 230)

- Sections Thursdays
  - AA: 8:30, AB: 9:30, both in More 221
  - No sections this week – not far enough along yet
Communications

- Course web site
- Discussion board
  - For anything related to the course
  - Join in! Help each other out
- Mailing list
  - You are automatically subscribed if you are enrolled
  - Will keep this fairly low-volume; limited to things that everyone needs to read
Requirements & Grading

- Roughly
  - 40% project
  - 15% individual written homework
  - 15% midterm exam (date tbd*)
  - 25% final exam
  - 5% other

We reserve the right to adjust as needed

*Midterm date: Nov. 4 (day after Thur. section)? Or Nov. 7 (following Monday)? Preferences?
Best way to learn about compilers is to build (at least parts of) one

Course project

Mini Java compiler: classes, objects, etc.

- But cut down to essentials

Generate executable x86(-64) code & run it

Completed in steps through the quarter

- Intermediate steps to keep you on schedule but where you wind up at the end is major part
Project Groups

- You should work in pairs
  - Pair programming strongly encouraged
- Space for group SVN repositories & other shared files provided
- Pick partners soon (end of this week or by beginning of next)
Academic Integrity

- We want a cooperative group working together to do great stuff!
- But: you must never misrepresent work done by someone else as your own, without proper credit
- Know the rules – ask if in doubt or if tempted
Books

- Four good books, all on Eng. Lib. Reserve:
  - Cooper & Torczon, *Engineering a Compiler*. “Official text” New edition this year, but first is still good.
  - Aho, Lam, Sethi, Ullman, “Dragon Book”, 2nd ed (but 1st ed is also fine)
  - Fischer, Cytron, LeBlanc, *Crafting a Compiler*
And the point is...

- How do we execute this?

```c
int nPos = 0;
int k = 0;
while (k < length) {
    if (a[k] > 0) {
        nPos++;
    }
}
```

- The computer only knows 1’s & 0’s
Structure of a Compiler

- First approximation
  - Front end: analysis
    - Read source program and understand its structure and meaning
  - Back end: synthesis
    - Generate equivalent target language program
Compiler must...

- recognize legal programs (& complain about illegal ones)
- generate correct code
- manage runtime storage of all variables/data
- agree with OS & linker on target format
Implications

- Need some sort of Intermediate Representation(s) (IR)
- Front end maps source into IR
- Back end maps IR to target machine code
- Often multiple IRs – higher level at first, lower level in later phases
Front End

- Usually split into two parts
  - Scanner: Responsible for converting character stream to token stream
    - Also: strips out white space, comments
  - Parser: Reads token stream; generates IR

- Both of these can be generated automatically
  - Source language specified by a formal grammar
  - Tools read the grammar and generate scanner & parser (either table-driven or hard-coded)
Scanner Example

- **Input text**
  ```
  // this statement does very little
  if (x >= y) y = 42;
  ```

- **Token Stream**
  ```
  IF LPAREN ID(x) GEQ ID(y) RPAREN ID(y) BECOMES INT(42) SCOLON
  ```

- **Notes:** tokens are atomic items, not character strings; comments & whitespace are *not* tokens (in most languages – counterexample: Python)
Parser Output (IR)

- Many different forms
  - Engineering tradeoffs have changed over time (e.g., memory is (almost) free these days)
- Common output from a parser is an abstract syntax tree
  - Essential meaning of the program without the syntactic noise
Parser Example

- **Token Stream Input**
  - IF
  - LPAREN
  - ID(x)
  - GEQ
  - ID(y)
  - RPAREN
  - ID(y)
  - BECOMES
  - INT(42)
  - SCOLON

- **Abstract Syntax Tree**
  - ifStmt
    - >=
    - assign
      - ID(x)
      - ID(y)
      - ID(y)
      - INT(42)
Static Semantic Analysis

- During or (more common) after parsing
  - Type checking
  - Check language requirements like proper declarations, etc.
  - Preliminary resource allocation
  - Collect other information needed by back end analysis and code generation

- Key data structure: Symbol Table(s)
  - Maps names -> meaning/types/details
Back End

Responsibilities

- Translate IR into target machine code
- Should produce “good” code
  - “good” = fast, compact, low power (pick some)
- Should use machine resources effectively
  - Registers
  - Instructions
  - Memory hierarchy
Back End Structure

- Typically split into two major parts
  - "Optimization" – code improvements
  - Target Code Generation (machine specific)
    - Instruction selection & scheduling
    - Register allocation
  - Usually walk the AST to generate lower-level intermediate code before optimization
The Result

- Input
  \[
  \text{if } (x \geq y) \\
  y = 42;
  \]

- Output
  
  ```
  mov eax,[ebp+16]
  cmp eax,[ebp-8]
  jl L17
  mov [ebp-8],42
  L17:
  ```
Interpreters & Compilers

- Compiler
  - A program that translates a program from one language (the source) to another (the target)

- Interpreter
  - A program that reads a source program and produces the results of executing that program on some input
Common Issues

- Compilers and interpreters both must read the input – a stream of characters – and “understand” it: front-end analysis phase

```c
while (k < length){
    if (a[k] > 0)
        nPos++;
}
```
Compiler

- Read and analyze entire program
- Translate to semantically equivalent program in another language
  - Presumably easier or more efficient to execute
- Offline process
- Tradeoff: compile-time overhead (preprocessing) vs execution performance
Typically implemented with Compilers

- FORTRAN, C, C++, COBOL, other programming languages, (La)TeX, SQL (databases), VHDL, many others

- Particularly appropriate if significant optimization wanted/needed
Interpreter

- Interpreter
  - Execution engine
  - Program analysis interleaved with execution
    running = true;
    while (running) {
      analyze next statement;
      execute that statement;
    }
  - Usually requires repeated analysis of individual statements (particularly in loops, functions)
  - But: immediate execution, good debugging & interaction, etc.
Often implemented with interpreters

- Javascript, PERL, Python, Ruby, awk, sed, shells (bash), Scheme/Lisp/ML, postscript/pdf, machine simulators

- Particularly efficient if interpreter overhead is low relative to execution cost of individual statements
  - But even if not (machine simulators), flexibility, immediacy, or portability may be worth it
Hybrid approaches

- Compiler generates byte code intermediate language, e.g. compile Java source to Java Virtual Machine .class files, then
- Interpret byte codes directly, or
- Compile some or all byte codes to native code
  - Variation: Just-In-Time compiler (JIT) – detect hot spots & compile on the fly to native code
- Also wide use for Javascript, many functional languages (Haskell, ML, Ruby), C# and Microsoft Common Language Runtime, others
Why Study Compilers? (1)

- Become a better programmer(!)
  - Insight into interaction between languages, compilers, and hardware
  - Understanding of implementation techniques, how code maps to hardware
  - What is all that stuff in the debugger anyway?
  - Better intuition about what your code does
Why Study Compilers? (2)

- Compiler techniques are everywhere
  - Parsing ("little" languages, interpreters, XML)
  - Software tools (verifiers, checkers, ...)
  - Database engines, query languages
  - AI, etc.: domain-specific languages
  - Text processing
    - Tex/LaTeX -> dvi -> Postscript -> pdf
  - Hardware: VHDL; model-checking tools
  - Mathematics (Mathematica, Matlab)
Why Study Compilers? (3)

- Fascinating blend of theory and engineering
  - Direct applications of theory to practice
    - Parsing, scanning, static analysis
  - Plus some very difficult problems (NP-hard or worse)
    - Resource allocation, “optimization”, etc.
    - Need to come up with good-enough approximations/heuristics
Why Study Compilers? (4)

- Draws ideas from many parts of CSE
  - AI: Greedy algorithms, heuristic search
  - Algorithms: graph algorithms, dynamic programming, approximation algorithms
  - Theory: Grammars, DFAs and PDAs, pattern matching, fixed-point algorithms
  - Systems: Allocation & naming, synchronization, locality
  - Architecture: pipelines, instruction set use, memory hierarchy management, locality
Why Study Compilers? (5)

- You might even write a compiler some day!

- You *will* write parsers and interpreters for little languages, if not bigger things
  - Command languages, configuration files, XML, network protocols, ...
Some History (1)

- 1950’s. Existence proof
  - FORTRAN I (1954) – competitive with hand-optimized code

- 1960’s
  - New languages: ALGOL, LISP, COBOL, SIMULA
  - Formal notations for syntax, esp. BNF
  - Fundamental implementation techniques
    - Stack frames, recursive procedures, etc.
Some History (2)

- 1970’s
  - Syntax: formal methods for producing compiler front-ends; many theorems
- Late 1970’s, 1980’s
  - New languages (functional; object-oriented - Smalltalk)
  - New architectures (RISC machines, parallel machines, memory hierarchy issues)
  - More attention to back-end issues
Some History (3)

- 1990s
  - Techniques for compiling objects and classes, efficiency in the presence of dynamic dispatch and small methods (Self, Smalltalk – now common in JVMs, etc.)
  - Just-in-time compilers (JITs)
  - Compiler technology critical to effective use of new hardware (RISC, parallel machines, complex memory hierarchies)
Some History (4)

- Last decade
  - Compilation techniques in many new places
    - Software analysis, verification, security
  - Phased compilation – blurring the lines between “compile time” and “runtime”
    - Using machine learning techniques to control optimizations(!)
  - Dynamic languages – e.g., JavaScript, ...
  - The new 800 lb gorilla - multicore
Compiler (and related) Turing Awards

- 1966 Alan Perlis
- 1972 Edsger Dijkstra
- 1974 Donald Knuth
- 1976 Michael Rabin and Dana Scott
- 1977 John Backus
- 1978 Bob Floyd
- 1979 Ken Iverson
- 1980 Tony Hoare
- 1984 Niklaus Wirth
- 1987 John Cocke
- 1991 Robin Milner
- 2001 Ole-Johan Dahl and Kristen Nygaard
- 2003 Alan Kay
- 2005 Peter Naur
- 2006 Fran Allen
- 2008 Barbara Liskov
Any questions?

- Your job is to ask questions to be sure you understand what’s happening and to slow me down
- Otherwise, I’ll barrel on ahead 😊
Coming Attractions

- Quick review of formal grammars
- Lexical analysis – scanning
  - Background for first part of the project
- Followed by parsing ...

- Start reading: ch. 1, 2.1-2.4
