Introduction to Data Management
CSE 414

Lecture 2: Data Models & SQL
(Ch. 2.1-2.3)
Announcements

• Office Hours are listed on the calendar
  – one every day, M-F

• If you have a laptop, bring to section Th
  – also look at HW1 for installing sqlite
  – can go through the examples yourself
Data Models

• language / notation for talking about data

• models we will use:
  – relational: data is a collection of tables
  – semi-structured: data is a tree

• other models:
  – key-value pairs: used by NoSQL systems
  – graph data model: used by RDF (semi-structured can also do)
  – object oriented: often layered on relational, J2EE
Relational Model

- Data is a collection of relations / tables:
  - mathematically, relation is a set of tuples
  - each tuple appears 0 or 1 times in the table
  - order of the rows is unspecified

<table>
<thead>
<tr>
<th>Name</th>
<th>Country</th>
<th>Employees</th>
<th>For_Profit</th>
</tr>
</thead>
<tbody>
<tr>
<td>GizmoWorks</td>
<td>USA</td>
<td>20000</td>
<td>True</td>
</tr>
<tr>
<td>Canon</td>
<td>Japan</td>
<td>50000</td>
<td>True</td>
</tr>
<tr>
<td>Hitachi</td>
<td>Japan</td>
<td>30000</td>
<td>True</td>
</tr>
<tr>
<td>HappyCam</td>
<td>Canada</td>
<td>500</td>
<td>False</td>
</tr>
</tbody>
</table>

rows / tuples / records

columns / attributes / fields
Relational Schema

• Each column has a “domain” (or type)
  – SQL has Java-like types for numbers, strings, etc.
  – domain is a constraint on the data allowed in the table

• Names and types part of the “schema” of the table:
  
  Company(Name: string, Country: string, 
            Employees: int, For_Profit: boolean)

• Particular data is an “instance” of that relation
  – data changes over time
  – DBMS usually just stores the current instance
Keys

• Key = subset of columns that uniquely identifies tuple
• Another constraint on the table
  – no two tuples can have the same values for those columns
• Examples:
  – Movie(title, year, length, genre) key is (title, year)
  – what is a good key for Company?
• Part of the schema (book notation is underline):
  
  Company(Name: string, Country: string,
           Employees: int, For_Profit: boolean)
Keys (cont.)

• Can have multiple keys for a table

• Only one of those keys may be “primary”
  – DBMS often makes searches by primary key fastest
  – other keys are called “secondary”

• ”Foreign key” is a column (or columns) whose value
  is a key of another table
  – i.e., a reference to another row in another table
SQL ("sequel")

- Standard query language for relational data
  - used for databases in many different contexts
  - inspires query languages for non-relational (e.g. SQL++)
- Everything not in quotes (‘…’) is case insensitive
- Provides standard types. Examples:
  - numbers: INT, FLOAT, DECIMAL(p,s)
  - strings: CHAR(n), VARCHAR(n)
  - BOOLEAN
  - DATE, TIME, TIMESTAMP
- Additional types differ by vendor:
  - SQLite: http://www.sqlite.org/datatype3.html
SQL statements

• create table …
• drop table …
• alter table … add/remove …
• insert into … values …
• delete from … where …
• update … set … where …
