

CSE 417 Algorithms

Winter 2020
Lecture 12

Minimum Spanning Trees (Part II)

Announcements

- Midterm, Monday, February 10
- Sections 1.1 through 5.2
- Wednesday and Friday
 - Divide and Conquer and Recurrences
- Homework 5, Due February 12 will not be graded

Minimum Spanning Tree

Undirected Graph $G=(V,E)$ with edge weights

For simplicity, assume all edge costs are distinct

Greedy Algorithms for Minimum Spanning Tree

- **[Prim]** Extend a tree by including the cheapest outgoing edge
- **[Kruskal]** Add the cheapest edge that joins disjoint components

Edge inclusion lemma

- Let S be a subset of V , and suppose $e = (u, v)$ is the minimum cost edge of E , with u in S and v in $V-S$
- e is in every minimum spanning tree of G
 - Or equivalently, if e is not in T , then T is not a minimum spanning tree

e is the minimum cost edge between S and $V-S$

Proof

- Suppose T is a spanning tree that does not contain e
- Add e to T , this creates a cycle
- The cycle must have some edge $e_1 = (u_1, v_1)$ with u_1 in S and v_1 in $V-S$

- $T_1 = T - \{e_1\} + \{e\}$ is a spanning tree with lower cost
- Hence, T is not a minimum spanning tree

Optimality Proofs

- Prim's Algorithm computes a MST
- Kruskal's Algorithm computes a MST
- Show that when an edge is added to the MST by Prim or Kruskal, the edge is the minimum cost edge between S and $V-S$ for some set S .

Prim's Algorithm

```
S = {}; T = {};  
while S != V  
    choose the minimum cost edge  
    e = (u,v), with u in S, and v in V-S  
    add e to T  
    add v to S
```

Prove Prim's algorithm computes an MST

- Show an edge e is in the MST when it is added to T

Kruskal's Algorithm

```
Let C = {{v1}, {v2}, ..., {vn}}; T = {}  
while |C| > 1  
    Let e = (u, v) with u in Ci and v in Cj be the  
    minimum cost edge joining distinct sets in C  
    Replace Ci and Cj by Ci U Cj  
    Add e to T
```

Prove Kruskal's algorithm computes an MST

- Show an edge e is in the MST when it is added to T

Application: Clustering

- Given a collection of points in an r -dimensional space and an integer K , divide the points into K sets that are closest together

Distance clustering

- Divide the data set into K subsets to maximize the distance between any pair of sets
 - $\text{dist}(S_1, S_2) = \min \{ \text{dist}(x, y) \mid x \text{ in } S_1, y \text{ in } S_2 \}$

Divide into 2 clusters

Divide into 3 clusters

Divide into 4 clusters

Distance Clustering Algorithm

Let $C = \{\{v_1\}, \{v_2\}, \dots, \{v_n\}\}$; $T = \{\}$

while $|C| > K$

Let $e = (u, v)$ with u in C_i and v in C_j be the minimum cost edge joining distinct sets in C

Replace C_i and C_j by $C_i \cup C_j$

K-clustering

Shortest paths in directed graphs vs undirected graphs

What about the minimum spanning tree of a directed graph?

- Must specify the root r
- Branching: Out tree with root r

Assume all vertices reachable from r

Also called an arborescence

Finding a minimum branching

Another MST Algorithm

- Choose minimum cost edge into each vertex
- Merge into components
- Repeat until done

Idea for branching algorithm

- Select minimum cost edge going into each vertex
- If graph is a branching then done
- Otherwise collapse cycles and repeat

Finding a minimum branching

- Remove all edges going into r
- Normalize the edge weights, so the minimum weight edge coming into each vertex has weight zero

This does not change the edges of the minimum branching

Finding a minimum branching

- Consider the graph that consists of the minimum cost edge coming in to each vertex
 - If this graph is a branching, then it is the minimum cost branching
 - Otherwise, the graph contains one or more cycles
 - Collapse the cycles in the original graph to super vertices
 - Reweight the graph and repeat the process

Finding a minimum branching

Correctness Proof

Lemma 4.38 Let C be a cycle in G consisting of edges of cost 0 with r not in C . There is an optimal branching rooted at r that has exactly one edge entering C .

- The lemma justifies using the edges of the cycle in the branching
- An induction argument is used to cover the multiple levels of compressing cycles
