

CSE 417 Algorithms

Richard Anderson
Lecture 15, Winter 2020
Divide and Conquer

What you really need to know about recurrences

- Work per level changes geometrically with the level
- Geometrically increasing ($x > 1$)
 - The bottom level wins
- Geometrically decreasing ($x < 1$)
 - The top level wins
- Balanced ($x = 1$)
 - Equal contribution

$$T(n) = aT(n/b) + n^c$$

- **Balanced:** $a = b^c$
 - $T(n) = 16T(n/4) + n^2$
- **Increasing:** $a > b^c$
 - $T(n) = 5T(n/3) + n$
 - $T(n) = 3T(n/4) + n^{1/2}$
- **Decreasing:** $a < b^c$
 - $T(n) = T(4n/5) + n$
 - $T(n) = 7T(n/2) + n^3$

Divide and Conquer Algorithms

- Split into sub problems
- Recursively solve the problem
- Combine solutions
- Make progress in the split and combine stages
 - Quicksort – progress made at the split step
 - Mergesort – progress made at the combine step
- D&C Algorithms
 - Strassen's Algorithm – Matrix Multiplication
 - Inversions
 - Median
 - Closest Pair
 - Integer Multiplication

How to multiply 2 x 2 matrices with 7 multiplications

Multiply 2 x 2 Matrices:
 $\begin{bmatrix} r & s \\ t & u \end{bmatrix} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} e & g \\ f & h \end{bmatrix}$

Where:

$$\begin{aligned} p_1 &= (b - d)(f + h) \\ p_2 &= (a + d)(e + h) \\ p_3 &= (a - c)(e + g) \\ p_4 &= (a + b)h \\ p_5 &= a(g - h) \\ p_6 &= d(f - e) \\ p_7 &= (c + d)e \end{aligned}$$

$$r = p_1 + p_2 - p_4 + p_6$$

$$s = p_4 + p_5$$

$$t = p_6 + p_7$$

$$u = p_2 - p_3 + p_5 - p_7$$

Aho, Hopcroft, Ullman 1974

Strassen's Algorithms

- Treat $n \times n$ matrices as 2×2 matrices of $n/2 \times n/2$ submatrices
- Use Strassen's trick to multiply 2×2 matrices with 7 multiplies
- Base case standard multiplication for single entries
- Recurrence: $T(n) = 7T(n/2) + cn^2$
- Solution is $O(7^{\log n}) = O(n^{\log 7})$ which is about $O(n^{2.807})$

Inversion Problem

- Let a_1, \dots, a_n be a permutation of $1 \dots n$
- (a_i, a_j) is an inversion if $i < j$ and $a_i > a_j$
 $4, 6, 1, 7, 3, 2, 5$
- Problem: given a permutation, count the number of inversions
- This can be done easily in $O(n^2)$ time
 - Can we do better?

Application

- Counting inversions can be used to measure how close ranked preferences are
 - People rank 20 movies, based on their rankings you cluster people who like that same type of movie

Counting Inversions

11 12 4 1 7 2 3 15 9 5 16 8 6 13 10 14

- Count inversions on lower half
- Count inversions on upper half
- Count the inversions between the halves

Count the Inversions

Problem – how do we count inversions between sub problems in $O(n)$ time?

- Solution – Count inversions while merging

1 2 3 4 7 11 12 15 5 6 8 9 10 13 14 16

Standard merge algorithm – add to inversion count when an element is moved from the upper array to the solution

Use the merge algorithm to count inversions

1 4 11 12

2 3 7 15

5 8 9 16

6 10 13 14

Indicate the number of inversions for each element detected when merging

Inversions

- Counting inversions between two sorted lists
 - $O(1)$ per element to count inversions

- Algorithm summary
 - Satisfies the "Standard recurrence"
 - $T(n) = 2 T(n/2) + cn$

Computing the Median

- Given n numbers, find the number of rank $n/2$
- One approach is sorting
 - Sort the elements, and choose the middle one
 - Can you do better?

Problem generalization

- Selection*, given n numbers and an integer k , find the k -th largest

Select(A, k)

```

Select(A, k){
  Choose element x from A
  S1 = {y in A | y < x}
  S2 = {y in A | y > x}
  S3 = {y in A | y = x}
  if (|S2| >= k)
    return Select(S2, k)
  else if (|S2| + |S3| >= k)
    return x
  else
    return Select(S1, k - |S2| - |S3|)
}
    
```

Randomized Selection

- Choose the element at random
- Analysis can show that the algorithm has expected run time $O(n)$

Deterministic Selection

- What is the run time of select if we can guarantee that choose finds an x such that $|S_1| < 3n/4$ and $|S_2| < 3n/4$ in $O(n)$ time

BFPRT Algorithm

- A very clever choose algorithm . . .

Split into $n/5$ sets of size 5
M be the set of medians of these sets
Let x be the median of M

BFPRT runtime

$$|S_1| < 3n/4, |S_2| < 3n/4$$

Split into $n/5$ sets of size 5
M be the set of medians of these sets
x be the median of M
Construct S_1 and S_2
Recursive call in S_1 or S_2

BFPRT Recurrence

- $T(n) \leq T(3n/4) + T(n/5) + c n$

Prove that $T(n) \leq 20 c n$
