CSE 417 Algorithms

Richard Anderson Autumn 2023 Lecture 5

Announcements

- HW 1 Due tonight on Gradescope, turn in open until Sunday, 11:59 pm
- HW 2 Available
 - Includes problems from LeetCode

Worst Case Runtime Function

- Problem P: Given instance I compute a solution S
- A is an algorithm to solve P
- T(I) is the number of steps executed by A on instance I
- T(n) is the maximum of T(I) for all instances of size n

Ignore constant factors

- Constant factors are arbitrary
 - Depend on the implementation
 - Depend on the details of the model
- Determining the constant factors is tedious and provides little insight
- Express run time as T(n) = O(f(n))

Formalizing growth rates

- T(n) is O(f(n)) $[T: Z^+ \rightarrow R^+]$
 - If n is sufficiently large, T(n) is bounded by a constant multiple of f(n)
 - Exist c, n_0 , such that for $n > n_0$, T(n) < c f(n)
- T(n) is Ω(f(n))
 - -T(n) is at least a constant multiple of f(n)
 - There exists an n_0 , and $\epsilon > 0$ such that $T(n) > \epsilon f(n)$ for all $n > n_0$
- T(n) is $\Theta(f(n))$ if T(n) is O(f(n)) and T(n) is $\Omega(f(n))$

Efficient Algorithms

- Polynomial Time (P): Class of all problems that can be solved with algorithms that have polynomial runtime functions
- Polynomial Time has been a very successful tool for theoretical computer science
- Problems in Polynomial Time often have practical solutions

Graph Theory

- G = (V, E)
 - V vertices
 - E edges
- Undirected graphs
 - Edges sets of two vertices {u, v}
- Directed graphs
 - Edges ordered pairs (u, v)
- Many other flavors
 - Edge / vertices weights
 - Parallel edges
 - Self loops

Definitions

- Path: $v_1, v_2, ..., v_k$, with (v_i, v_{i+1}) in E
 - Simple Path
 - Cycle
 - Simple Cycle
- Neighborhood
 - N(v)
- Distance
- Connectivity
 - Undirected
 - Directed (strong connectivity)
- Trees
 - Rooted
 - Unrooted

Graph Representation

V = { a, b, c, d}

 $\mathsf{E} = \{ \ \{a, \ b\}, \ \{a, \ c\}, \ \{a, \ d\}, \ \{b, \ d\} \ \}$

Adjacency List

	1	1	1
1		0	1
1	0		0
1	1	0	

Incidence Matrix

Implementation Issues

- Graph with n vertices, m edges
- Operations
 - Lookup edge
 - Add edge
 - Enumeration edges
 - Initialize graph
- Space requirements

Graph search

• Find a path from s to t

 $S = {s}$ while S is not empty u = Select(S)visit u foreach v in N(u) if v is unvisited Add(S, v)Pred[v] = uif (v = t) then path found

Breadth first search

- Explore vertices in layers
 - -s in layer 1
 - Neighbors of s in layer 2
 - Neighbors of layer 2 in layer 3 . . .

Key observation

• All edges go between vertices on the same layer or adjacent layers

Bipartite Graphs

- A graph V is bipartite if V can be partitioned into V₁, V₂ such that all edges go between V₁ and V₂
- A graph is bipartite if it can be two colored

Can this graph be two colored?

Algorithm

- Run BFS
- Color odd layers red, even layers blue
- If no edges between the same layer, the graph is bipartite
- If edge between two vertices of the same layer, then there is an odd cycle, and the graph is not bipartite

Theorem: A graph is bipartite if and only if it has no odd cycles

Lemma 1

• If a graph contains an odd cycle, it is not bipartite

Lemma 2

 If a BFS tree has an *intra-level edge*, then the graph has an odd length cycle

Intra-level edge: both end points are in the same level
