

## CSE 417 Algorithms

Richard Anderson  
Autumn 2023  
Lecture 5

## Announcements

- HW 1 Due tonight on Gradescope, turn in open until Sunday, 11:59 pm
- HW 2 Available
  - Includes problems from LeetCode

## Worst Case Runtime Function

- Problem P: Given instance I compute a solution S
- A is an algorithm to solve P
- $T(I)$  is the number of steps executed by A on instance I
- $T(n)$  is the maximum of  $T(I)$  for all instances of size n

## Ignore constant factors

- Constant factors are arbitrary
  - Depend on the implementation
  - Depend on the details of the model
- Determining the constant factors is tedious and provides little insight
- Express run time as  $T(n) = O(f(n))$

## Formalizing growth rates

- $T(n)$  is  $O(f(n))$   $[T: \mathbb{Z}^+ \rightarrow \mathbb{R}^+]$ 
  - If n is sufficiently large,  $T(n)$  is bounded by a constant multiple of  $f(n)$
  - Exist  $c, n_0$ , such that for  $n > n_0$ ,  $T(n) < c f(n)$
- $T(n)$  is  $\Omega(f(n))$ 
  - $T(n)$  is at least a constant multiple of  $f(n)$
  - There exists an  $n_0$ , and  $\varepsilon > 0$  such that  $T(n) > \varepsilon f(n)$  for all  $n > n_0$
- $T(n)$  is  $\Theta(f(n))$  if  $T(n)$  is  $O(f(n))$  and  $T(n)$  is  $\Omega(f(n))$

## Efficient Algorithms

- Polynomial Time (P): Class of all problems that can be solved with algorithms that have polynomial runtime functions
- Polynomial Time has been a very successful tool for theoretical computer science
- Problems in Polynomial Time often have practical solutions

## Graph Theory

- $G = (V, E)$ 
  - $V$  – vertices
  - $E$  – edges
- Undirected graphs
  - Edges sets of two vertices  $\{u, v\}$
- Directed graphs
  - Edges ordered pairs  $(u, v)$
- Many other flavors
  - Edge / vertices weights
  - Parallel edges
  - Self loops

## Definitions

- Path:  $v_1, v_2, \dots, v_k$ , with  $(v_i, v_{i+1})$  in  $E$ 
  - Simple Path
  - Cycle
  - Simple Cycle
- Neighborhood
  - $N(v)$
- Distance
- Connectivity
  - Undirected
  - Directed (strong connectivity)
- Trees
  - Rooted
  - Unrooted

## Graph Representation

 $V = \{a, b, c, d\}$ 
 $E = \{(a, b), (a, c), (a, d), (b, d)\}$ 

Adjacency List

	1	1	1
1		0	1
1	0		0
1	1	0	

Incidence Matrix

## Implementation Issues

- Graph with  $n$  vertices,  $m$  edges
- Operations
  - Lookup edge
  - Add edge
  - Enumeration edges
  - Initialize graph
- Space requirements

## Graph search

- Find a path from  $s$  to  $t$

```

S = {s}
while S is not empty
  u = Select(S)
  visit u
  foreach v in N(u)
    if v is unvisited
      Add(S, v)
      Pred[v] = u
    if (v = t) then path found
  
```

## Breadth first search

- Explore vertices in layers
  - $s$  in layer 1
  - Neighbors of  $s$  in layer 2
  - Neighbors of layer 2 in layer 3 . . .

### Key observation

- All edges go between vertices on the same layer or adjacent layers

### Bipartite Graphs

- A graph  $V$  is bipartite if  $V$  can be partitioned into  $V_1, V_2$  such that all edges go between  $V_1$  and  $V_2$
- A graph is bipartite if it can be two colored

### Can this graph be two colored?

### Algorithm

- Run BFS
- Color odd layers red, even layers blue
- If no edges between the same layer, the graph is bipartite
- If edge between two vertices of the same layer, then there is an odd cycle, and the graph is not bipartite

Theorem: A graph is bipartite if and only if it has no odd cycles

### Lemma 1

- If a graph contains an odd cycle, it is not bipartite

## Lemma 2

- If a BFS tree has an *intra-level edge*, then the graph has an odd length cycle

Intra-level edge: both end points are in the same level
