# Network Flow Definitions

- Flowgraph: Directed graph with distinguished vertices  $s$  (source) and  $t$  (sink)
- Capacities on the edges,  $c(e) \geq 0$
- Problem, assign flows  $f(e)$  to the edges such that:
  - $0 \leq f(e) \leq c(e)$
  - **Flow is conserved at vertices other than  $s$  and  $t$** 
    - Flow conservation: flow going into a vertex equals the flow going out
  - **The flow leaving the source is as large as possible**

# Residual Graph

- Flow graph showing the remaining capacity
- Flow graph  $G$ , Residual Graph  $G_R$ 
  - $G$ : edge  $e$  from  $u$  to  $v$  with capacity  $c$  and flow  $f$
  - $G_R$ : edge  $e'$  from  $u$  to  $v$  with capacity  $c - f$
  - $G_R$ : edge  $e''$  from  $v$  to  $u$  with capacity  $f$

# Augmenting Path Algorithm

- Augmenting path in residual graph
  - Vertices  $v_1, v_2, \dots, v_k$ 
    - $v_1 = s, v_k = t$
    - Possible to add  $b$  units of flow between  $v_j$  and  $v_{j+1}$  for  $j = 1 \dots k-1$

# Adding flow along a path in the residual graph

- Let  $P$  be an  $s$ - $t$  path in the residual graph with capacity  $b$
- $b$  units of flow can be added along  $P$  in the graph  $G$
- Need to show:
  - new flow satisfies capacity constraints
  - new flow satisfies conservation constraints

# Ford-Fulkerson Algorithm (1956)

while not done

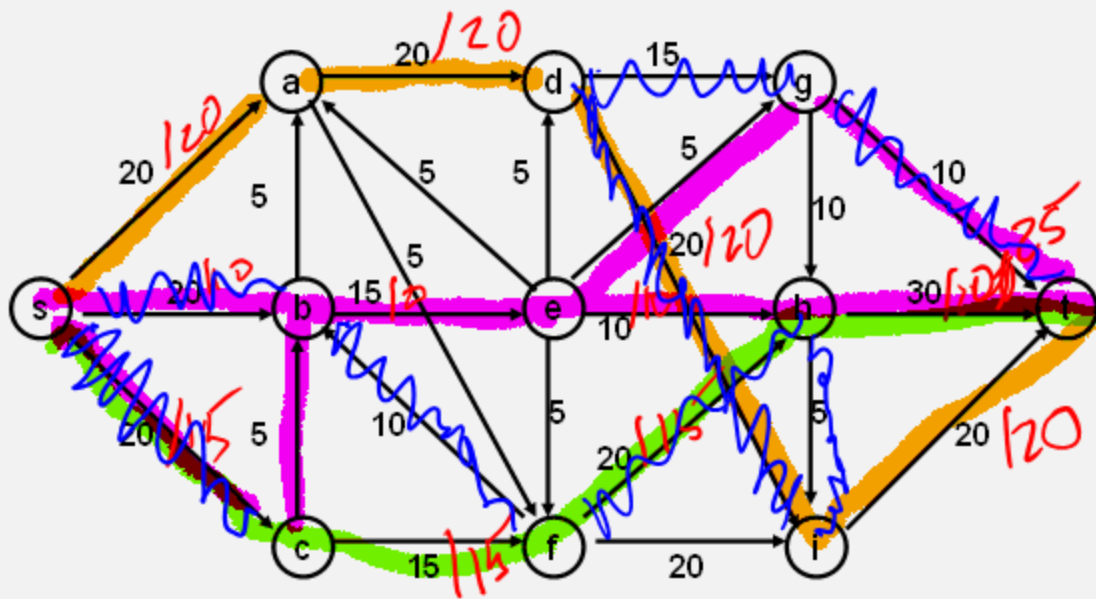

    Construct residual graph  $G_R$

    Find an s-t path  $P$  in  $G_R$  with capacity  $b > 0$

    Add  $b$  units of flow along path  $P$  in  $G$

If the sum of the capacities of edges leaving  $S$  is at most  $C$ , then the algorithm takes at most  $C$  iterations

# Flow Example I

9

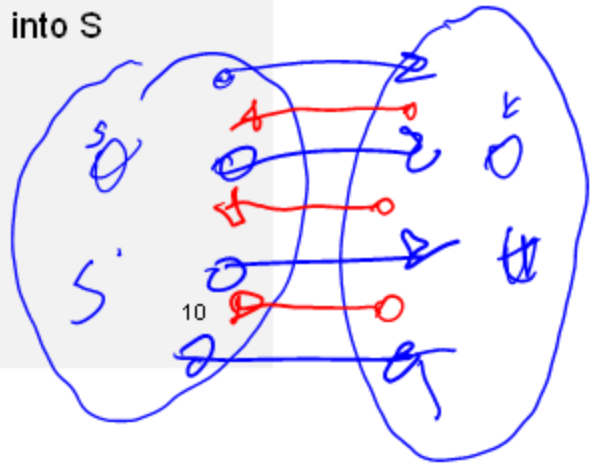

# Cuts in a graph

- Cut: Partition of  $V$  into disjoint sets  $S$ ,  $T$  with  $s$  in  $S$  and  $t$  in  $T$ .
- $\text{Cap}(S,T)$ : sum of the capacities of edges from  $S$  to  $T$
- $\text{Flow}(S,T)$ : net flow out of  $S$ 
  - Sum of flows out of  $S$  minus sum of flows into  $S$

- $\text{Flow}(S,T) \leq \text{Cap}(S,T)$

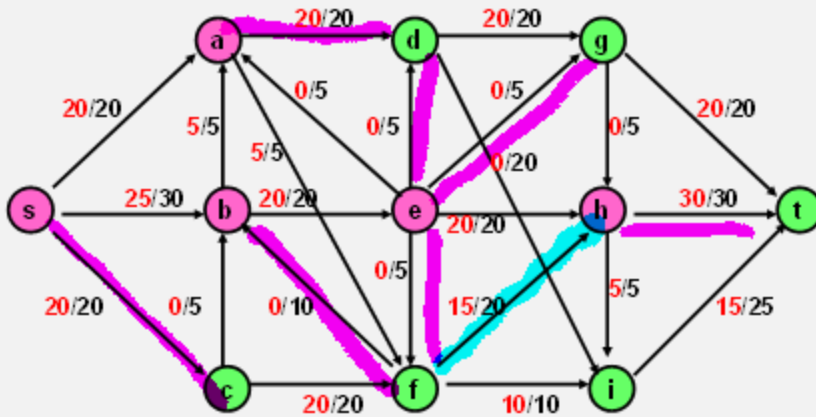

11/29/2023

CSE 417

# What is Cap(S,T) and Flow(S,T)

$S = \{s, a, b, e, h\}$ ,  $T = \{c, f, i, d, g, t\}$

11/29/2023

CSE 417

$$\text{Cap}(S, T) = 20 + 20 + 10 + \dots$$

$$\text{Flow}(S, T) = 20 + 20 + 30 + \dots - 15$$

# What is $\text{Cap}(S,T)$ and $\text{Flow}(S,T)$

$$S = \{s, a, b, e, h\}, \quad T = \{c, f, i, d, g, t\}$$

$$\text{Cap}(S,T) = 95,$$

$$\text{Flow}(S,T) = 80 - 15 = 65$$

# Minimum value cut

# Find a minimum value cut

17

# Find a minimum value cut

# Find a minimum value cut

# MaxFlow – MinCut Theorem

- There exists a flow which has the same value of the minimum cut
- Proof: Consider a flow where the residual graph has no s-t path with positive capacity
- Let  $S$  be the set of vertices in  $G_R$  reachable from  $s$  with paths of positive capacity

Let  $S$  be the set of vertices in  $G_R$  reachable from  $s$  with paths of positive capacity

$$\text{Flow}(S, T) = \text{Cap}(S, T)$$

$$\begin{aligned} \text{cap}(v, u) &= 0 \text{ in } G_R \\ \text{cap}(u, v) &= \text{flow}(u, v) \text{ in } G \\ \text{flow}(v, u) &= 0 \text{ in } G \end{aligned}$$

What can we say about the flows and capacity between  $u$  and  $v$ ?

# Max Flow - Min Cut Theorem

- Ford-Fulkerson algorithm finds a flow where the residual graph is disconnected, hence FF finds a maximum flow.
- If we want to find a minimum cut, we begin by looking for a maximum flow.

# History

- Ford / Fulkerson studied network flow in the context of the Soviet Rail Network

11/29/2023

20

# Ford Fulkerson Runtime

$$O(Cm)$$

- Cost per phase  $\times$  number of phases
- Phases
  - Capacity leaving source:  $C$
  - Add at least one unit per phase
- Cost per phase
  - Build residual graph:  $O(m)$
  - Find s-t path in residual:  $O(m)$

# Performance

*- 2000 phase*

- The worst case performance of the Ford-Fulkerson algorithm is horrible

11/29/2023

CSE 417

22

# Better methods of finding augmenting paths

- **Find the maximum capacity augmenting path**
  - $O(m^2 \log(C))$  time algorithm for network flow
- **Find the shortest augmenting path**
  - $O(m^2 n)$  time algorithm for network flow
- **Find a blocking flow in the residual graph**
  - $O(mn \log n)$  time algorithm for network flow

# Problem Reduction

- Reduce Problem A to Problem B
  - Convert an instance of Problem A to an instance of Problem B
  - Use a solution of Problem B to get a solution to Problem A
- Practical
  - Use a program for Problem B to solve Problem A
- Theoretical
  - Show that Problem B is at least as hard as Problem A

# Problem Reduction Examples

- Reduce the problem of finding the Maximum of a set of integers to finding the Minimum of a set of integers

Find the maximum of: 8, -3, 2, 12, 1, -6

Construct an equivalent minimization problem

# Undirected Network Flow

- Undirected graph with edge capacities
- Flow may go either direction along the edges (subject to the capacity constraints)

Construct an equivalent flow problem

# Bipartite Matching

- A graph  $G=(V,E)$  is bipartite if the vertices can be partitioned into disjoint sets  $X,Y$
- A matching  $M$  is a subset of the edges that does not share any vertices
- Find a matching as large as possible

# Application

- A collection of teachers
- A collection of courses
- And a graph showing which teachers can teach which courses

# Converting Matching to Network Flow

# Multi-source network flow

- **Multi-source network flow**
  - Sources  $s_1, s_2, \dots, s_k$
  - Sinks  $t_1, t_2, \dots, t_j$
- **Solve with Single source network flow**

# Resource Allocation: Assignment of reviewers

- A set of papers  $P_1, \dots, P_n$
- A set of reviewers  $R_1, \dots, R_m$
- Paper  $P_i$  requires  $A_i$  reviewers
- Reviewer  $R_j$  can review  $B_j$  papers
- For each reviewer  $R_j$ , there is a list of paper  $L_{j1}, \dots, L_{jk}$  that  $R_j$  is qualified to review
