CSE 417 Algorithms

Richard Anderson Winter 2023 Lecture 5

Announcements

- HW 1 Due tonight on Gradescope, turn in open until Sunday, 11:59 pm
- · HW 2 Available

Worst Case Runtime Function

- Problem P: Given instance I compute a solution S
- · A is an algorithm to solve P
- T(I) is the number of steps executed by A on instance I
- T(n) is the maximum of T(l) for all instances of size n

Ignore constant factors

- · Constant factors are arbitrary
 - Depend on the implementation
 - Depend on the details of the model
- Determining the constant factors is tedious and provides little insight
- Express run time as T(n) = O(f(n))

Formalizing growth rates

- T(n) is O(f(n)) $[T:Z^+ \rightarrow R^+]$
 - If n is sufficiently large, T(n) is bounded by a constant multiple of f(n)
 - Exist c, n_0 , such that for $n > n_0$, T(n) < c f(n)
- T(n) is Ω(f(n))
 - T(n) is at least a constant multiple of f(n)
 - There exists an n_0 , and $\epsilon > 0$ such that $T(n) > \epsilon f(n)$ for all $n > n_0$
- T(n) is Θ(f(n)) if T(n) is O(f(n)) and T(n) is Ω(f(n))

Efficient Algorithms

- Polynomial Time (P): Class of all problems that can be solved with algorithms that have polynomial runtime functions
- Polynomial Time has been a very successful tool for theoretical computer science
- Problems in Polynomial Time often have practical solutions

Graph Theory

- G = (V, E)
 - V vertices
 - E edges
- · Undirected graphs
 - Edges sets of two vertices {u, v}
- · Directed graphs
 - Edges ordered pairs (u, v)
- · Many other flavors
 - Edge / vertices weights
 - Parallel edges
 - Self loops

Definitions

- Path: $v_1, v_2, ..., v_k$, with (v_i, v_{i+1}) in E Simple Path

 - Cycle
- Simple Cycle Neighborhood
- -N(v)
- Distance
- Connectivity
 - Undirected - Directed (strong connectivity)
- Trees
 - Rooted

Graph Representation $V = \{ a, b, c, d \}$ $E = \{ \, \{a, \, b\}, \, \{a, \, c\}, \, \{a, \, d\}, \, \{b, \, d\} \, \}$ $a \rightarrow b \rightarrow c \rightarrow d$ → a → d 1 0 0 0 → a 1 0 $d \rightarrow a \rightarrow b$ Adjacency List Incidence Matrix

Implementation Issues

- · Graph with n vertices, m edges
- Operations
 - Lookup edge
 - Add edge
 - Enumeration edges
 - Initialize graph
- Space requirements

Graph search

· Find a path from s to t

 $S = \{s\}$ while S is not empty u = Select(S) visit u foreach v in N(u) if v is unvisited Add(S, v) Pred[v] = uif (v = t) then path found

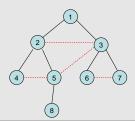

Breadth first search

- · Explore vertices in layers
 - -s in layer 1
 - Neighbors of s in layer 2
 - Neighbors of layer 2 in layer 3 . .

Key observation

 All edges go between vertices on the same layer or adjacent layers

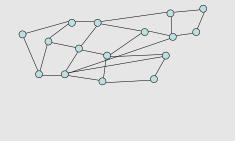

Bipartite Graphs

- A graph V is bipartite if V can be partitioned into V₁, V₂ such that all edges go between V₁ and V₂
- · A graph is bipartite if it can be two colored

Can this graph be two colored?

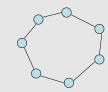

Algorithm

- Run BFS
- Color odd layers red, even layers blue
- If no edges between the same layer, the graph is bipartite
- If edge between two vertices of the same layer, then there is an odd cycle, and the graph is not bipartite

Theorem: A graph is bipartite if and only if it has no odd cycles

Lemma 1

If a graph contains an odd cycle, it is not bipartite

Lemma 2

• If a BFS tree has an *intra-level edge*, then the graph has an odd length cycle

Intra-level edge: both end points are in the same level

Lemma 3

If a graph has no odd length cycles, then it is bipartite

Graph Search

 Data structure for next vertex to visit determines search order

Graph search

S = {s}
while S is not empty
u = Dequeue(S)
if u is unvisited
visit u
foreach v in N(u)

Enqueue(S, v)

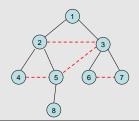

Breadth First Search

$$\label{eq:definition} \begin{split} \text{Depth First Search} \\ S &= \{s\} \\ \text{while S is not empty} \\ u &= \text{Pop(S)} \\ \text{if u is unvisited} \\ \text{visit u} \\ \text{foreach v in N(u)} \end{split}$$

Push(S, v)

Breadth First Search

 All edges go between vertices on the same layer or adjacent layers

Depth First Search

 Each edge goes between vertices on the same branch

· No cross edges
