Low-fi Prototyping & Pilot Usability Testing (Group)

Due: Tuesday, February 26, 2013

Overview
The goal of this assignment is to learn how to use low-fi prototyping in the early stages of UI design. You will first build a low-fi prototype and then perform a simple usability test. You will incorporate the results of the test into design changes in your prototype for the next assignment.

Requirements
Now that you have had a chance to work with your teammates and develop your project idea, create a team mission statement that describes your goal for the project.

Your low-fi test will use the three (3) or more tasks that you turned into scenarios in the last assignment (unless we ask that you change them). These benchmark tasks should include 1 simple task, 1 moderate task, and 1 complex task. These tasks should give good coverage of your interface.

Design and construct your low-fidelity prototype. Use the techniques described in the Snyder chapter as a guideline. Your low-fi prototype will be made on paper.

You will find at least three (3) participants to work through your tasks. You should not use friends or class members. Nor should you use people who have been exposed to your project. The type of people you use should be based on your contextual inquiry. Remember it must be voluntary. You should get them to sign a consent form ensuring their confidentiality (see an example at http://www.cs.washington.edu/education/courses/cse440/13wi/assignment_files/consent-form.htm).

Testing Procedure
Have one of your teammates demo the system to show the real participant how they would interact with your prototyped system. Do not show your participants exactly how to perform your tasks. Just show how the system works in general and give an example of something specific that is different enough from your tasks.

You should write up a script of your demo and follow the same script with each participant. The participant will then be given task directions for the first task that tells them what they are trying to achieve, not how to do it. When they are finished, you will give them the directions for the next task and so on. Keep each task on a separate card.

During the experiment, you should make a log of critical incidents (both positive and negative events). For example, the user might make a mistake or they might see something they like and say, “cool.” Write it down along with a description of what was going on. Later you should prioritize these events and assign severity ratings to the problems (use the ratings we discussed in the Heuristic Evaluation lecture – 0 for no problem to 4 for usability catastrophe).

Each participant will perform all 3 tasks. Keep the data separate for each task and participant. Keep participant names confidential.
Deliverables

You will write up your design, experiment, and results, and put the report online on your web site and in the class dropbox, and one member of your team will make an in-class presentation.

Written Report

Your essay should be no more than 5 pages of text (images are free). Your essay should follow the outline below and will be graded using the guidelines detailed on the next page.

1. **Title**, each team member’s name, role, and a URL to an online copy of this essay
2. Introduction and Mission Statement (1/4 page)
3. Prototype description, with sketches and a picture of the entire system (1 page)
4. Method
   1. Participants (1 paragraph)
   2. Environment (1 paragraph)
   3. Tasks (1/2 page)
   4. Procedure (1/2 page)
   5. Test Measures (1 paragraph)
5. Results (3/4 page)
6. Discussion (3/4 page)
7. Appendices (as many pages as necessary - link from text into the appendices
   1. include all forms handed out to participants
   2. include raw data (cleaned up and readable)
   3. include any extra figures that don’t fit in the body

hint: put images inline (i.e., where they belong in the text) along with a caption and figure number (reference the figure number in the body of the report).

Here are four good reports to check out from prior classes: What’s Happening, TripMe, TaskMan, and UpLift

Class Presentation

One member of your team will present your project in class during a six-minute PowerPoint-based presentation. See the grading guidelines for information on how to structure your talk. Practice in advance! You must make the slides available for download on your web site. Look at the final presentations from this class in 2012 to see what good slides look like.

There will be a mandatory practice session with the TAs the evening before.
Writing and Experimentation Guidelines

Introduction and Mission Statement (10 pts)
Briefly introduce the system being evaluated, and state the purpose and rationale behind the experiment. Then, present your mission statement. As described in The Discipline of Teams, the mission statement should represent the common purpose and goal of the project. Each member of the team should agree on and be committed to achieving the mission statement.

Prototype (20 pts)
Describe your prototype. What are the main pieces of functionality? What are the main interaction ideas? How does the user operate it? Reference sketches of the interface screens in your description (scan them in). Finally, take one picture of the entire paper-based system with all of its elements laid out.

Method (20 pts)
Describe the participants in the experiment and how they were selected. Also describe the testing environment and how the prototype and any other equipment were set up. Include images.

Describe some details of your testing procedure. This should include the experimental roles of each member of the team. To prepare for the experiment, you should assign team members to the different tasks (i.e., computer, facilitator, etc.) and practice with someone playing the participant.

The test measures detail what you looked for or measured during the experiment. You should concentrate on process data (i.e., what is happening in the big picture) in addition to bottom-line data (i.e., time or # of errors).

Results (20 pts)
Summarize the results of the experiment from your process data.

Discussion (20 pts)
Discuss your results. What did you learn from the experiment? How will the results change the design of your interface? Was there anything that the experiment could not reveal?

Appendix (10 pts)
The appendix should include copies of all materials involved in the experiment. This includes your consent form, demo script, and any instructions or task descriptions you handed out or read out loud to your participants.

Finally, it should include all the raw process data you gathered during the experiment. Clean it up to make it easier to read. Merge the critical incidents logged by the observers and list them here.

The appendix materials and screenshots do not count in your 5-page total.
Presentation Guidelines

The presentation grading will be broken into two components: the individual grade of the presenter and a group grade for the presentation of the study results & initial UI design ideas. Note that you should use images liberally and try to keep the text on the slides brief (and use large fonts – no less than 20 pt anywhere). The grades for each of these components are explained in more detail below.

Presenter's grades (NAME: ____________________________)

- Suggested Organization
  - Overview of talk (1 slide) – don’t read this, tell it like a story
  - Team mission statement (1 slide)
  - 3 representative tasks (1-3 slides)
  - Lo-fi prototype structure (1 slide - mainly images)
  - 3 scenarios shown carrying out each task w/ lo-fi (1 slide + animation/each)
  - Experimental method (1 slide)
  - Experimental results (1 slide)
  - Suggested UI changes (1 slide)
  - Summary of talk (1 slide)

- Presentation
  - Use slides. Ensure that the presentation shows appropriate preparation, and that visual aids are effective, properly prepared, and properly employed. Make sure that people at the back of the room can see your slides.
  - Cover the required scope within the 6 minute time period (there will be 1 extra minute for questions). Practice & time your presentation in advance. We will cut you off if you go over and you will not be able to gain points for missed material.
  - Ensure the presenter makes eye contact and projects well.

Group grade (GROUP NAME: ____________________________)

- Mission Statement
  - Was the mission compelling and achievable?

- Representative Tasks & Scenarios
  - Did they provide coverage of the functionality?
  - Where the tasks too easy or too hard?

- Lo-fi Prototype
  - Was the interface novel and creative?
  - Was it appropriate for the supported tasks?
  - Did it follow from sound reasoning?
  - Were appropriate low-fi techniques/style used?

- Experiment
  - Was the experiment carried out in a sound manner?
  - Were the results given in sufficient detail to understand what occurred?
  - Were the suggested UI improvements sound & follow from the results?
