

CSE 442 - Data Visualization

Scalable Visualization

Jeffrey Heer University of Washington

Varieties of "big data"...

Tall Data

Lots of records

Large DBs have petabytes or more
(but median DB still fits in RAM!)

How to manage?

Parallel data processing

Reduction: Filter, aggregate

Sample or approximate

Not just about systems. Consider perceptual / cognitive scalability.

Tall Data

Wide data

Lots of variables (100s-1000s...)

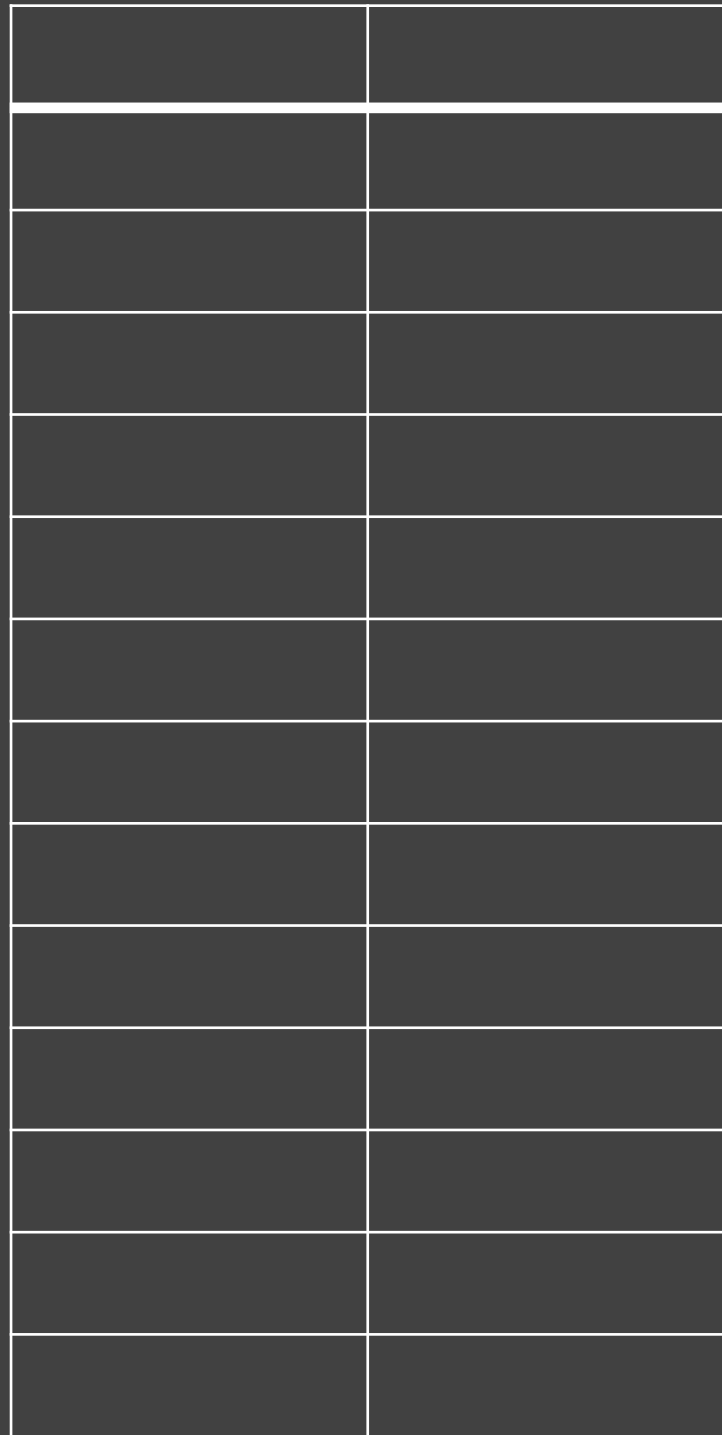

Select relevant subset

Dimensionality reduction

Statistical methods can suggest
and order related variables

Requires human judgment

Tall Data

Wide data

Diverse data

Tall Data

Wide data

Diverse data

How can we visualize and
interact with **billion+ record**
databases in real-time?

Two Challenges:

1. Effective **visual encoding**
2. Real-time **interaction**

Perceptual and interactive scalability should be limited by the **chosen resolution** of the visualized data, not the number of records.

1. Visualizing Large Datasets

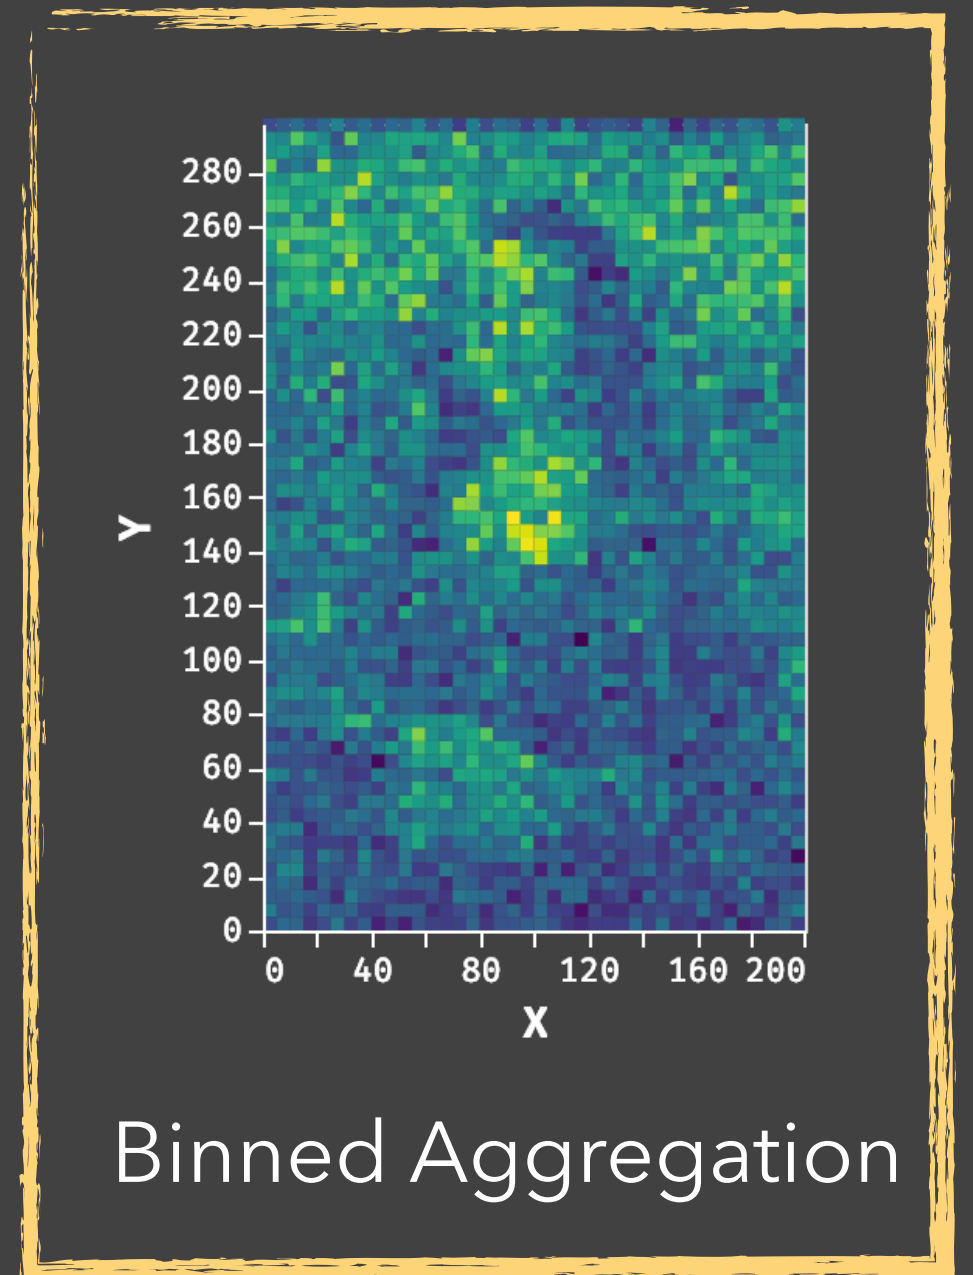

How to **Visualize** a Billion+ Records

Data

Sampling

Binned Aggregation

Decouple the visual complexity from the raw data through aggregation.

Bin > Aggregate (> Smooth) > Plot

1. Bin Divide data domain into discrete “buckets”

Categories: Already discrete (but watch out for high cardinality)

Numbers: Choose bin intervals (uniform, quantile, ...)

Time: Choose time unit: Hour, Day, Month, etc.

Geo: Bin x, y coordinates *after* cartographic projection

Bin > Aggregate (> Smooth) > Plot

1. Bin Divide data domain into discrete “buckets”

Categories: Already discrete (but watch out for high cardinality)

Numbers: Choose bin intervals (uniform, quantile, ...)

Time: Choose time unit: Hour, Day, Month, etc.

Geo: Bin x, y coordinates *after* cartographic projection

2. Aggregate Count, Sum, Average, Min, Max, ...

Bin > Aggregate (> Smooth) > Plot

1. Bin Divide data domain into discrete “buckets”

Categories: Already discrete (but watch out for high cardinality)

Numbers: Choose bin intervals (uniform, quantile, ...)

Time: Choose time unit: Hour, Day, Month, etc.

Geo: Bin x, y coordinates *after* cartographic projection

2. Aggregate Count, Sum, Average, Min, Max, ...

3. Smooth Optional: smooth aggregates [Wickham '13]

Bin > Aggregate (> Smooth) > Plot

1. Bin Divide data domain into discrete “buckets”

Categories: Already discrete (but watch out for high cardinality)

Numbers: Choose bin intervals (uniform, quantile, ...)

Time: Choose time unit: Hour, Day, Month, etc.

Geo: Bin x, y coordinates *after* cartographic projection

2. Aggregate Count, Sum, Average, Min, Max, ...

3. Smooth Optional: smooth aggregates [Wickham '13]

4. Plot Visualize the aggregate values

Design Subtleties...

Hexagonal or Rectangular Bins?

100,000 Data Points

Hexagonal Bins

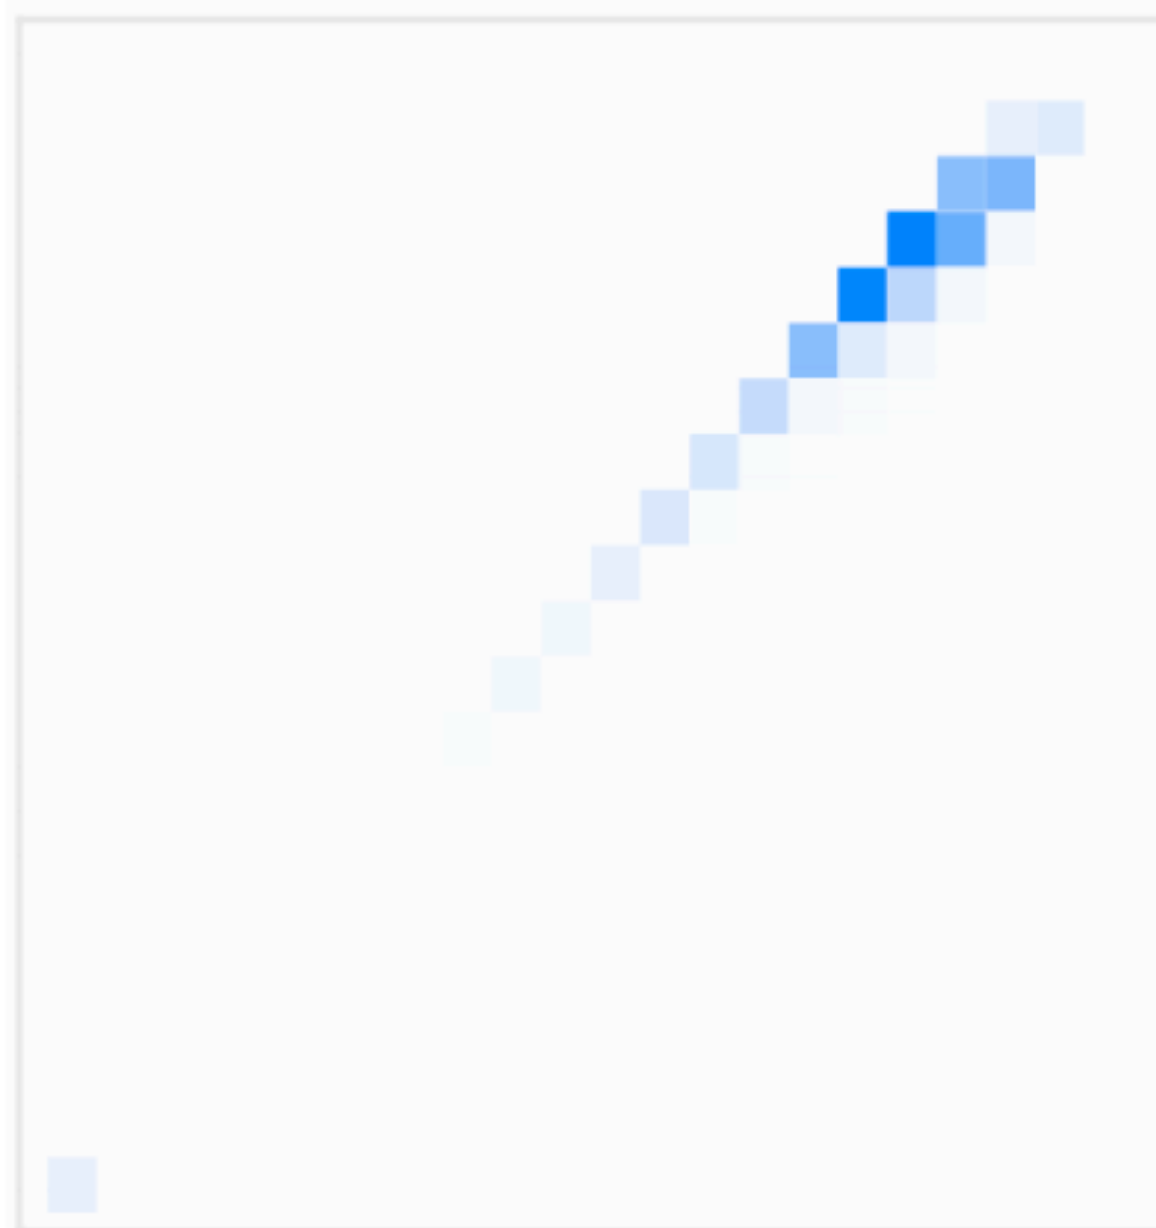

Rectangular Bins

Hex bins better estimate density for 2D plots, but the *improvement is marginal* [Scott 92].

Rectangles support *reuse* and *visual queries*.

Color Scale: Discontinuity after Zero

Standard Color Ramp
Counts near zero are white.

Add Discontinuity after Zero
Counts near zero remain visible.

Examples

Example: Binned Scatter Plots

Scatterplot Matrix
Techniques for Large N
[Carr et al. '87]

Example: Basketball Shot Chart

NBA Shooting 2011-12
[Goldsberry]

Example: Density Line Chart [Moritz & Fisher]

Line Chart

Non-Normalized Heatmap

Normalized "DenseLines"

The non-normalized heatmap suffers from artifacts, seen as vertical stripes. Binned charts convey high points across the top, a collective dip in stocks during the crash of 2008, and two distinct bands of \$25 and \$15 stocks.

Example: Density Line Chart [Moritz & Fisher]

Repeat for each series

Non-Normalized

Example: Density Line Chart [Moritz & Fisher]

Approx. Arc-Length Normalized

Example: Density Line Chart [Moritz & Fisher]

Approx. Arc-Length Normalized

Aggregate

Color

Example: Density Line Chart [Moritz & Fisher]

Example Time Series

10k Series, Normalized

10k Series, Non-Normalized

The density of the second group appears to increase to the right!

Without normalization, the steep lines are over-represented.

2. Enabling Real-Time Interaction

Interactive Scalability Strategies

- 1. Query Database**
- 2. Client-Side Indexing / Data Cubes**
- 3. Prefetching**
- 4. Approximation**

Interactive Scalability Strategies

1. Query Database Offload to a scalable backend

Tableau, for example, issues aggregation queries.

Analytical databases are designed for fast, parallel execution.

But round-trip queries to the DB may still be too slow...

2. Client-Side Indexing / Data Cubes

3. Prefetching

4. Approximation

Interactive Scalability Strategies

1. Query Database

2. Client-Side Indexing / Data Cubes Query data summaries

Build sorted indices or data cubes to quickly re-calculate aggregations as needed on the client.

3. Prefetching

4. Approximation

Interactive Scalability Strategies

1. Query Database

2. Client-Side Indexing / Data Cubes

3. Prefetching Request data *before* it is needed

Reduce latency by speculatively querying for data before it is needed. Requires prediction models to guess what is needed.

4. Approximation

Interactive Scalability Strategies

1. Query Database

2. Client-Side Indexing / Data Cubes

3. Prefetching

4. **Approximation** Give fast, approximate answers

Reduce latency by computing aggregates on a sample, ideally with approximation bounds characterizing the error.

Interactive Scalability Strategies

1. Query Database
2. Client-Side Indexing / Data Cubes
3. Prefetching
4. Approximation

These strategies are **not** mutually exclusive!

Systems can apply them in tandem.

imMens

[Liu, Jiang & Heer '13]

Strategies: Client-Side Data Cubes

Sampling Google Fusion Tables

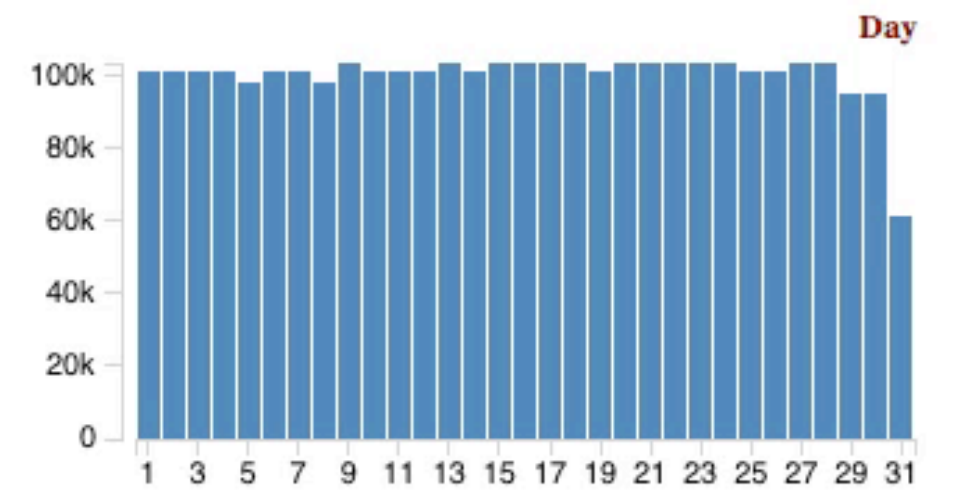

**Binned Aggregation
imMens**

**Sampling
Google Fusion Tables**

Binned Aggregation
imMens

5-D Data Cube

Month, Day, Hour, X, Y

~2.3B bins

5-D Data Cube

Month, Day, Hour, X, Y

~2.3B bins

Multivariate Data Tiles

1. Send data, not pixels
2. Embed multi-dim data

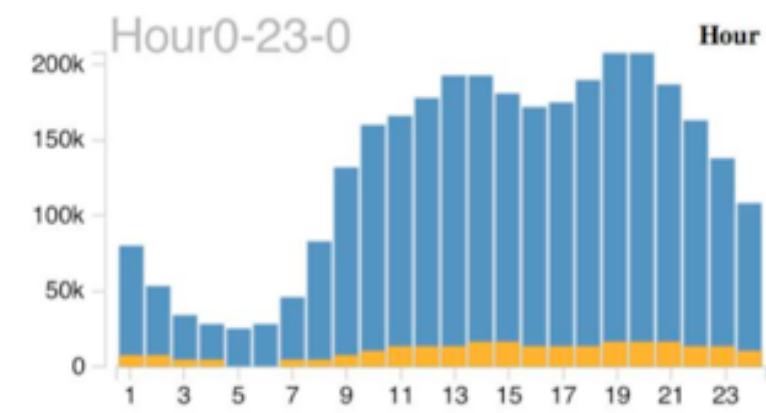

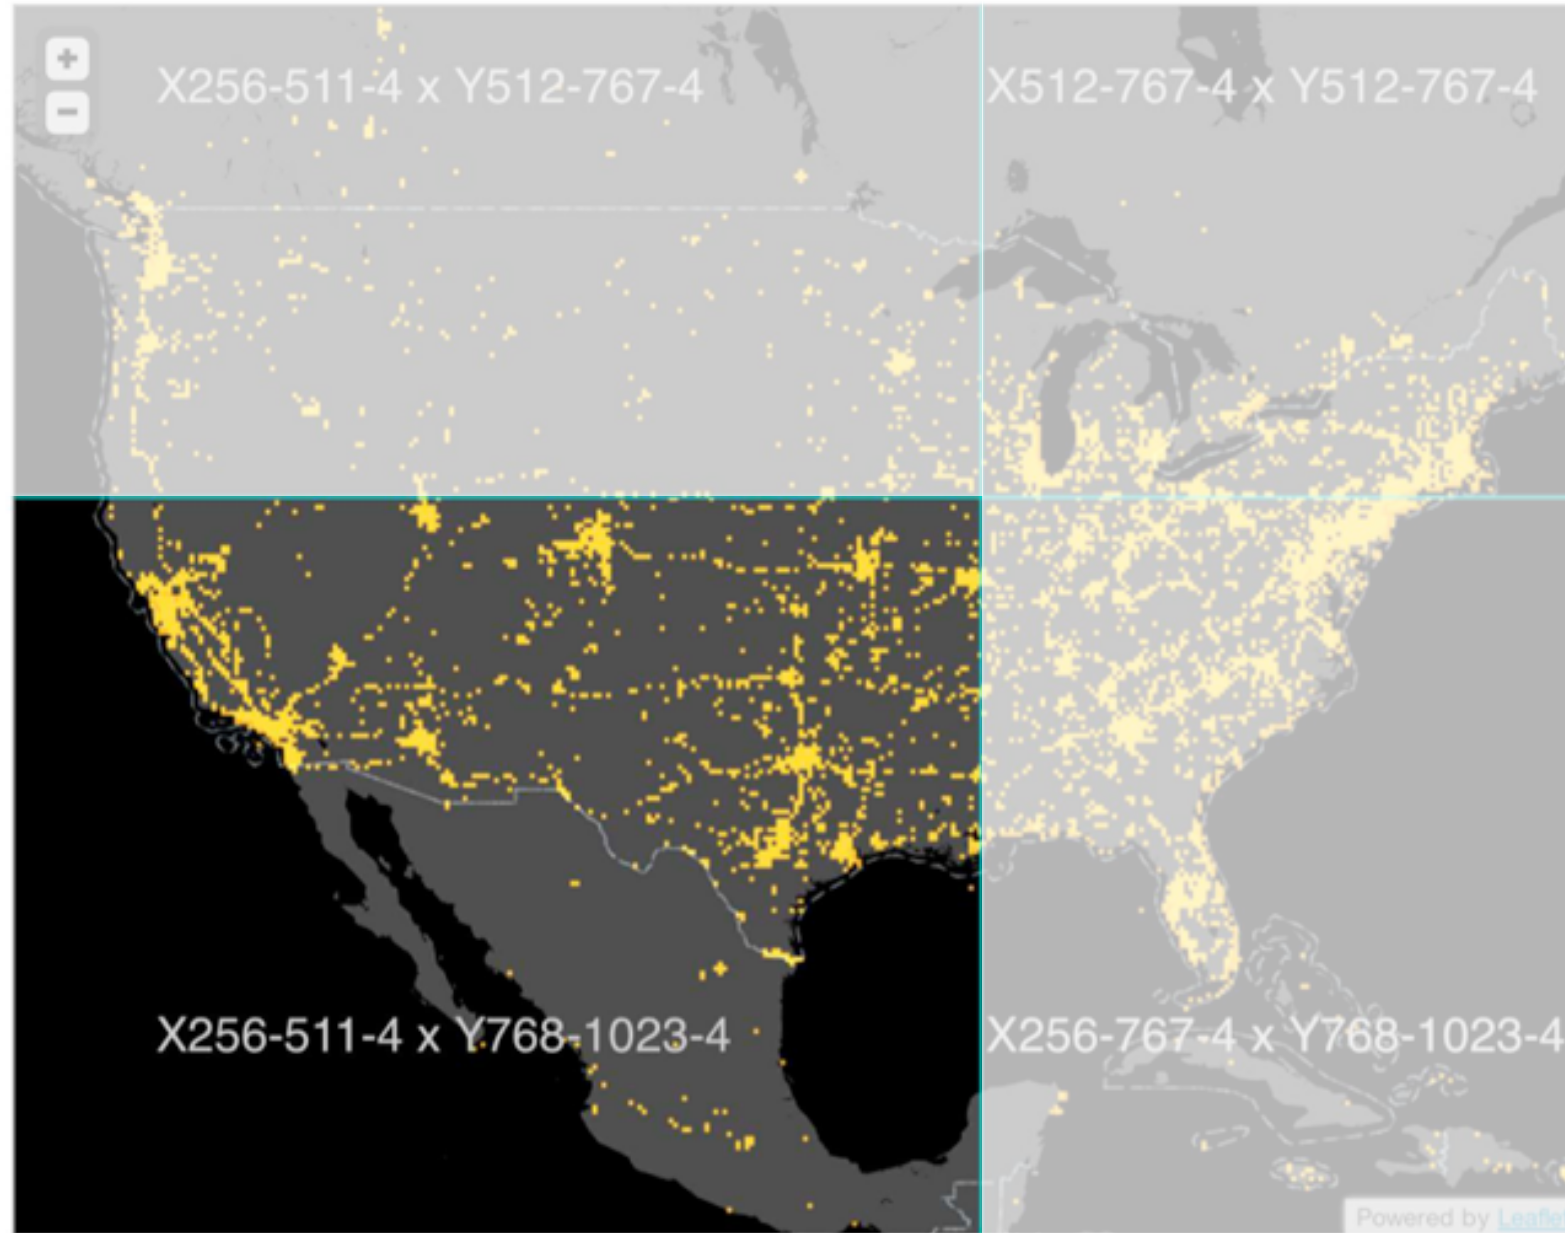

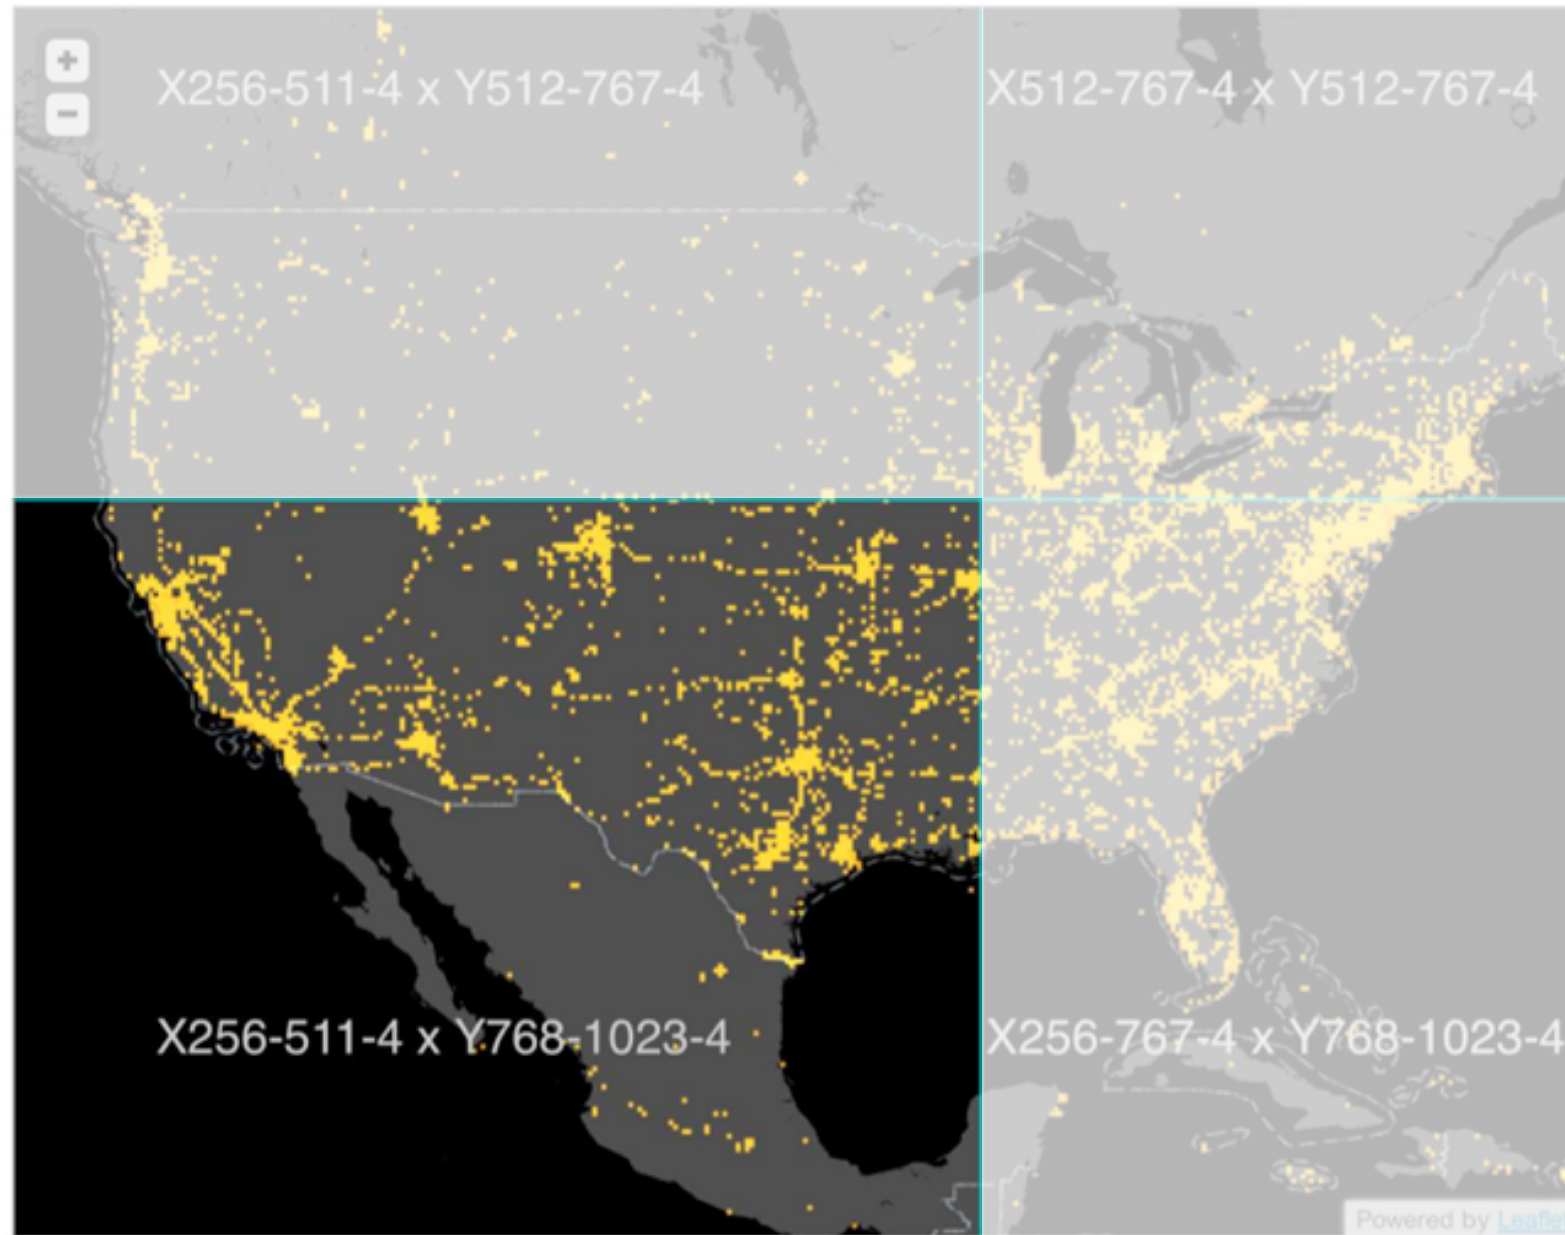

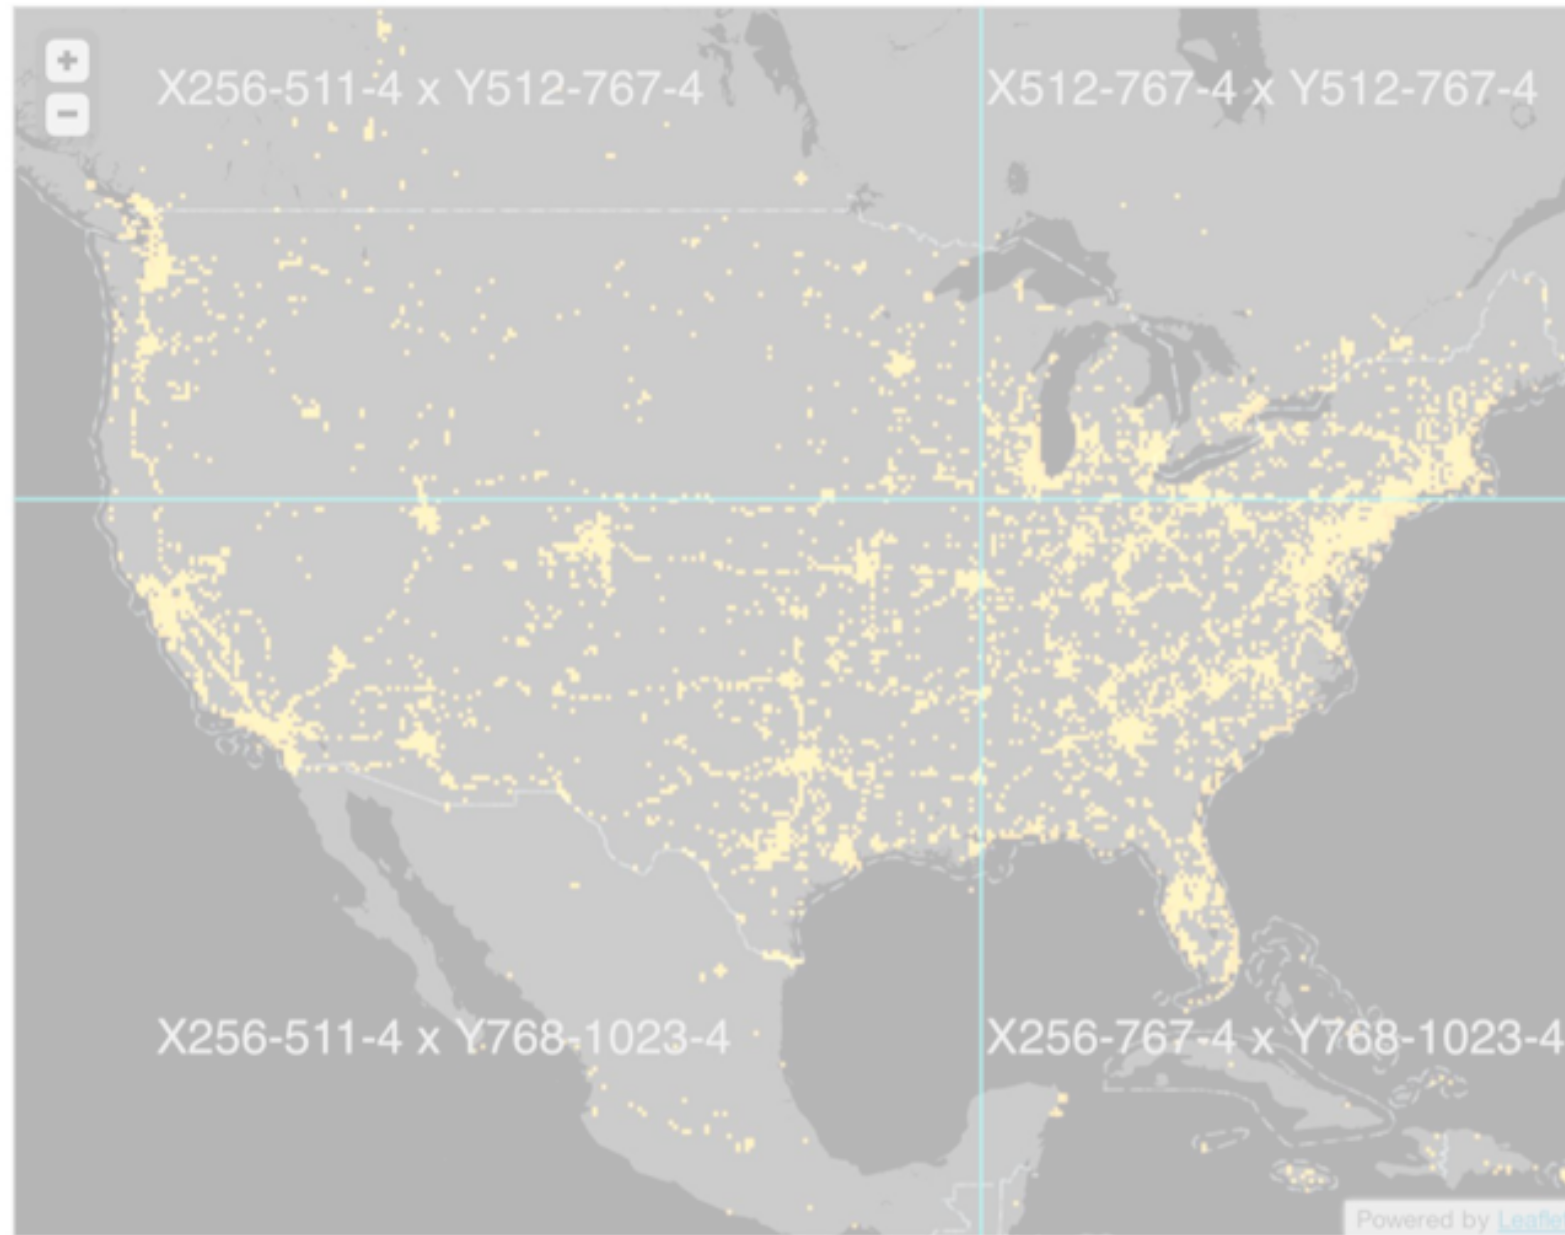

Full 5-D Cube

For any pair of 1D or 2D binned plots, the maximum number of dimensions needed to support brushing & linking is **four**.

Full 5-D Cube

13 3-D Data Tiles

Full 5-D Cube

→ ~2.3B bins

13 3-D Data Tiles

→ ~17.6M bins
(in 352KB!)

Performance Benchmarks

Simulate interaction:
brushing & linking
across binned plots.

- 4x4 and 5x5 plots
- 10 to 50 bins

Measure time from
selection to render.

Test setup:

2.3 GHz MacBook Pro
NVIDIA GeForce GT 650M
Google Chrome v.23.0

5 dimensions x 50 bins/dim x 25 plots

~50fps querying of visual summaries of **1B data points.**

imMens

In-Memory Data Cube

Limitations and Questions

But where do the multivariate data tiles come from?

They must be provided by a backend server. This can be time-consuming, particularly if supporting deep levels of zooming. imMens assumes that tiles have either been pre-computed or that a backing database can suitably generate them on demand.

Does super-low-latency interaction really matter?

Is it worth it to go to all of this trouble? (Short answer: yes!)

High latency leads to reduced analytic output [Liu & Heer, InfoVis 2014]

Administrivia

Final Project Schedule

Read the [video guide on the course website](#).

Tell a story, don't just catalog features.

How does **interactive latency** affect exploratory analysis with visualizations?

[Liu & Heer '14]

Prior Work

Higher latency entails higher action costs, subjects satisfice by selecting strategies that *reduce short-term effort* with no guarantee that the final outcome is optimized. [Gray & Boehm-Davis]

Prior Work

Higher latency entails higher action costs, subjects satisfice by selecting strategies that *reduce short-term effort* with no guarantee that the final outcome is optimized. [Gray & Boehm-Davis]

300ms latency reduces the number of Google searches; effect persists for days. [Brutlag et al]

Prior Work

Higher latency entails higher action costs, subjects satisfice by selecting strategies that *reduce short-term effort* with no guarantee that the final outcome is optimized. [Gray & Boehm-Davis]

300ms latency reduces the number of Google searches; effect persists for days. [Brutlag et al]

When the cost of acquiring information is increased, subjects change strategy and rely more on working memory. [Ballard et al]

Prior Work

Higher latency entails higher action costs, subjects satisfice by selecting strategies that *reduce short-term effort* with no guarantee that the final outcome is optimized. [Gray & Boehm-Davis]

When confronted with increased latencies, users resort to more mental planning, at times making fewer errors and performing better on tasks with *verifiable outcomes*. [O'Hara & Payne]

Prior Work

Higher latency entails higher action costs, subjects satisfice by selecting strategies that *reduce short-term effort* with no guarantee that the final outcome is optimized. [Gray & Boehm-Davis]

When confronted with increased latencies, users resort to more mental planning, at times making fewer errors and performing better on tasks with *verifiable outcomes*. [O'Hara & Payne]

But what about *open, exploratory analysis tasks*?

Experiment Design

2 (Latency) x 2 (Scenario) Design

Latency: +0ms / +500ms

Scenario: Mobile Check-ins / FAA Flight Delays

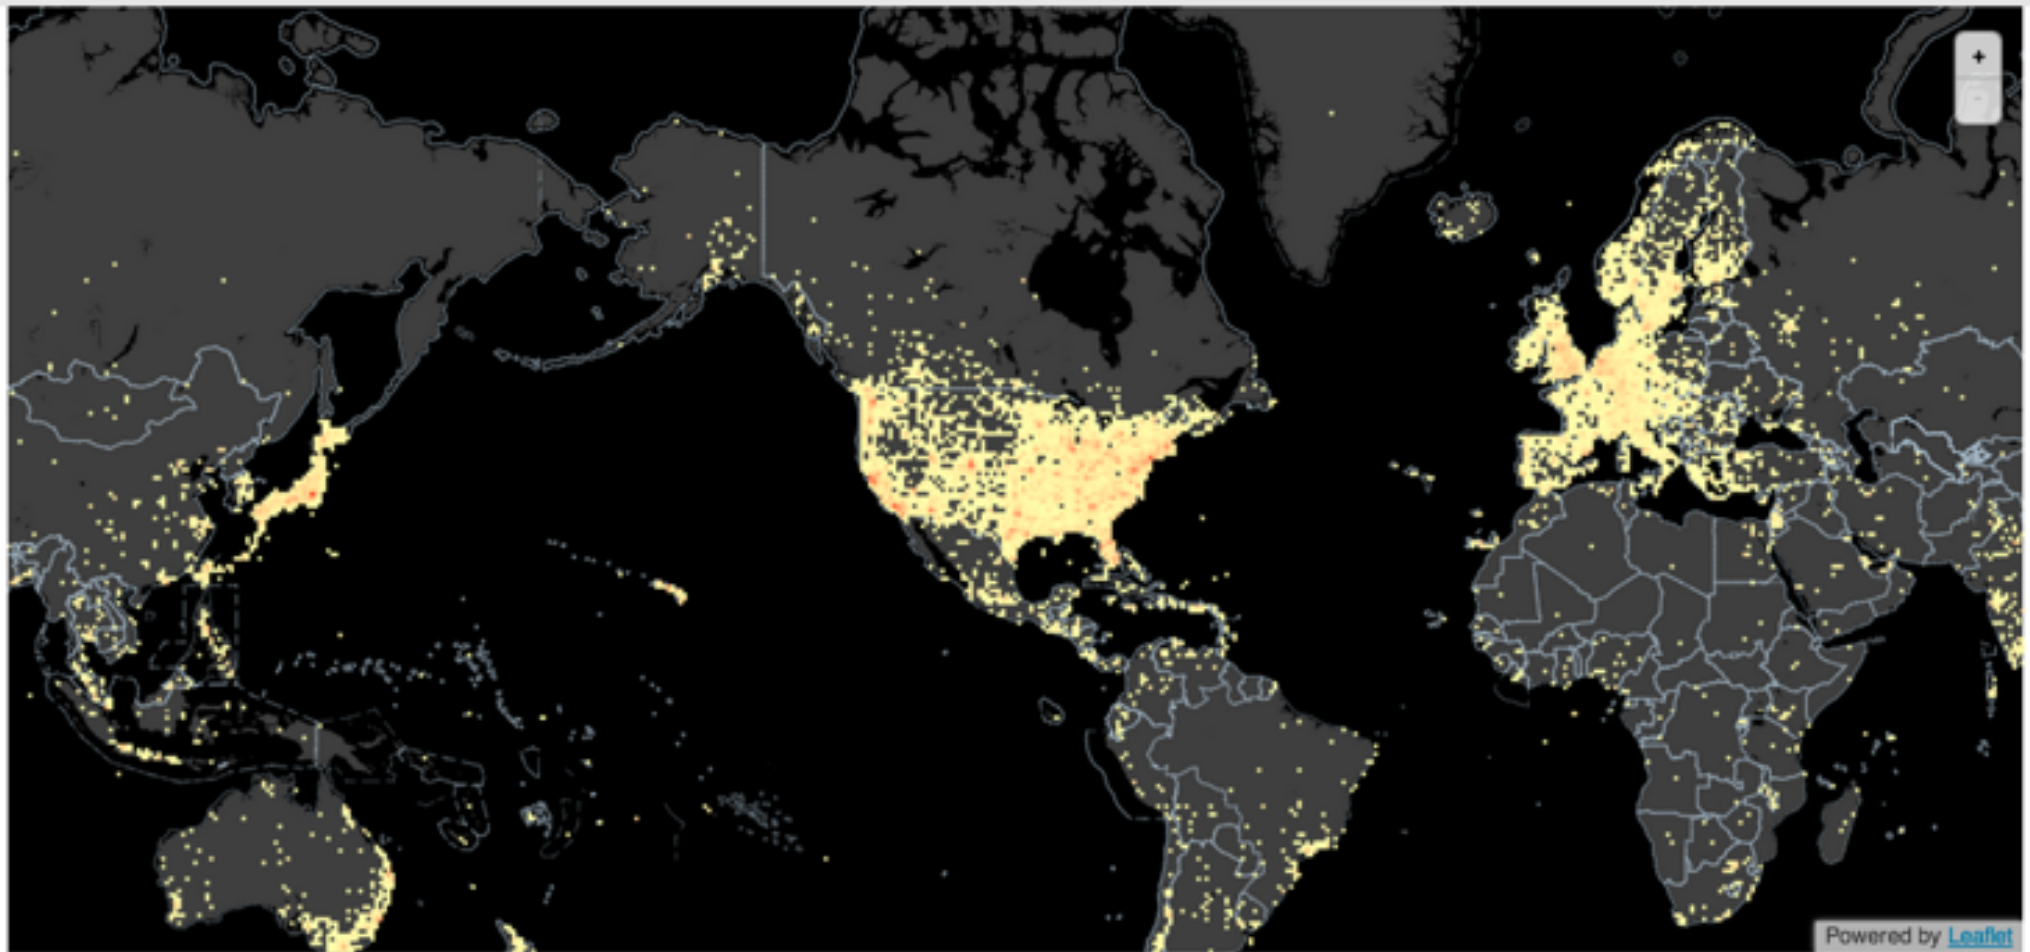

Exploratory Analysis Tasks (2 per session)

imMens with brush, pan, zoom, adjust scales

Users asked to explore data and share findings

Log events, record audio and screen capture

16 subjects, all familiar with data analysis + vis

4.5m Mobile Check-Ins

Significantly fewer brushing actions

Latency Study Results

Higher latency leads to...

Reduced user activity and data set coverage

Significantly fewer brushing actions

Less observation, generalization & hypothesis

Latency Study Results

Higher latency leads to...

Reduced user activity and data set coverage

Significantly fewer brushing actions

Less observation, generalization & hypothesis

Interaction effect: Exposure to delay reduces subsequent performance in low-latency interface.

Latency Study Results

Higher latency leads to...

Reduced user activity and data set coverage

Significantly fewer brushing actions

Less observation, generalization & hypothesis

Interaction effect: Exposure to delay reduces subsequent performance in low-latency interface.

Different interactions exhibit varied sensitivity to latency. Brushing is highly sensitive!

Latency Study Results

Higher latency leads to...

Reduced user activity and data set coverage

Significantly fewer brushing actions

Less observation, generalization & hypothesis

Interaction effect: Exposure to delay reduces subsequent performance in low-latency interface.

Different interactions exhibit varied sensitivity to latency. Brushing is highly sensitive!

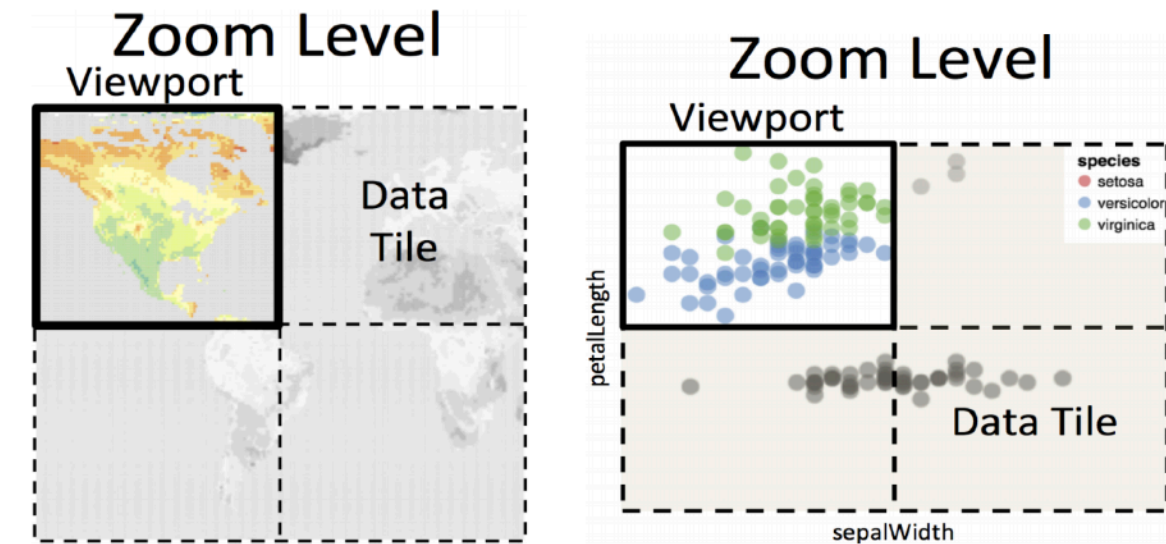

In short: milliseconds matter! And imMens was not a waste of time... 😊💧

ForeCache

[Battle, Chang, & Stonebraker '16]

Strategies: Query Database, Prefetching

ForeCache is also a Data Tile-Based System

(a) **Satellite Imagery** (b) **Multidimensional**

(c) **Timeseries (Heart rate Monitoring)**

Manage a Cache of Tiles from DB

Example Tile-Based Views

Key Idea: Model & Predict User Behavior

1. Classify Analysis Phase

Foraging: Searching for patterns of interest

Sensemaking: Closely examine a region-of-interest (ROI)

Navigation: Transition between levels of detail

Train a machine learning classifier (SVM) to predict phase.

The input data is the activity trace of user interactions.

Key Idea: Model & Predict User Behavior

1. Classify Analysis Phase

2. Apply Prediction Models

Actions-Based: Use recent interactions to predict next ones.

You pan left twice; what is the probability you will do it again?

Signature-Based: Match to data characteristics of interest.

What data tiles are visually similar to current focus tiles?

These models are weighted based on the analysis phase.

Actions-Based for *navigation*. *Signature-Based* for *sensemaking*. Both applied equally for *foraging*.

Application: MODIS Satellite Data

Analyzing snow cover in a scientific database. ROI = Region of Interest

ForeCache improves latency:

430% better than current non-prefetching systems

88% better than existing prediction methods

Falcon

How does Falcon support fine-grained real-time interaction?

Falcon Interaction Log

5x speedup

Brushing interactions

- 👁️ Brushing is more common and people are sensitive to latencies.
- 💡 Prioritize **brushing** latency over **view switching** latency.

Key Idea:

User-centered prefetching and indexing to support all brushing interactions with one view.

Re-compute if the user switches the view.

brushes in the precomputed view

serves requests from a data cube

Data Cube. Gray et al. 1997.

brushes in the precomputed view

serves requests from a data cube
Data Cube. Gray et al. 1997.

interacts with a new view

query for new data cubes

Constant data & time.
Client only.

brushes in the precomputed view

serves requests from a data cube
Data Cube. Gray et al. 1997.

💡 Aggregation decouples interactions from queries over the raw data.

Requires one pass
over the data.

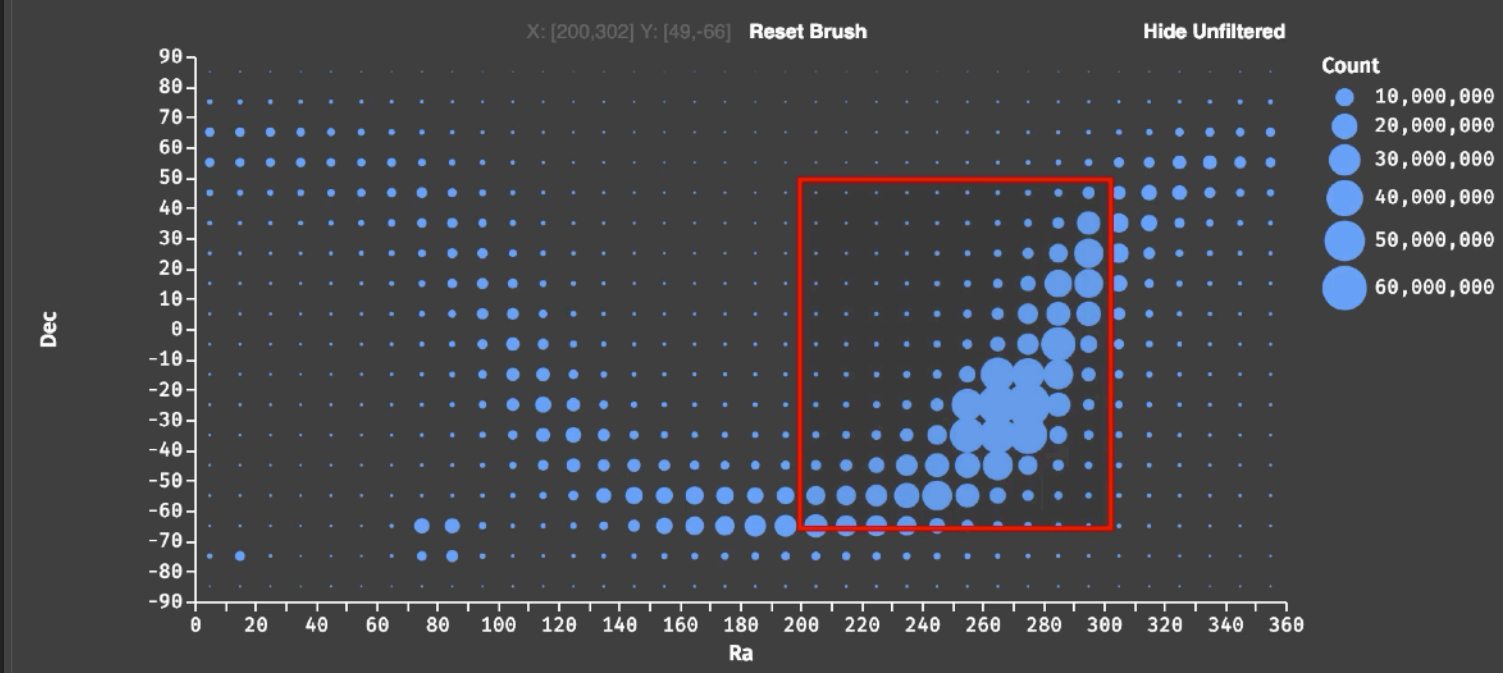

interacts with a new view

query for new data cubes

💡 View switches are **rare** and users are **not as latency sensitive** with them.

1.7 B stars.
1.2 TB of data.
Visualizations running in my browser.
Data stored in OmniSci database.

"With Falcon it feels like I'm
really interacting with my data."

Data Platform Engineer at Stitch Fix

What if data is **too large** to
query in a **reasonable time**?

Trust, but Verify: Optimistic Vis

[Moritz, Fisher, Ding & Wang '17]

Strategies: Query Database, Approximation

Latencies reduce engagement and lead to fewer observations.

The Effect of Interactive Latency. Liu, Heer. *IEEE InfoVis 2014*.

Small chance
of error

Small chance
Very likely to have at least one error
of error

Small chance
of error

Small chance
of error

Approximation: Trade Accuracy for Speed

- Approximate query processing (AQP)
- Uncertainty estimation in statistics
- Uncertainty visualization
- Probabilistic programming
- Approximate hardware

Pick your poison:

1. Trust the approximation, or
2. Wait for everything to complete.

This glass
is half full

Optimistic Visualization

Trust but Verify

What if we think of the
issues with approximation as
user experience problems?

Optimistic Visualization

Trust but Verify. Moritz et al. *CHI 2017*.

1. Analysts uses initial estimates.
2. Precise queries run in the background.
3. System confirms results. Analyst detects errors.

Analysts can use approximations and also trust them.

Pangloss Implements Optimistic Visualization

Evaluation

Case studies with teams at Microsoft who brought in *their own data*.

Approximation works

“seeing something right away at first glimpse is really great”

Need for guarantees

“[with a competitor] I was willing to wait 70-80 seconds. It wasn’t ideally interactive, but it meant I was looking at all the data.”

Optimism works

“I was thinking what to do next— and I saw that it had loaded, so I went back and checked it . . . [the passive update is] very nice for not interrupting your workflow.”

In Conclusion...

Two Challenges:

1. Effective **visual encoding**
2. Real-time **interaction**

Perceptual and interactive scalability should be limited by the **chosen resolution** of the visualized data, not the number of records.

Bin > Aggregate (> Smooth) > Plot

- 1. Bin** Divide data domain into discrete “buckets”
- 2. Aggregate** Count, Sum, Average, Min, Max, ...
- 3. Smooth** *Optional*: smooth aggregates [Wickham '13]
- 4. Plot** Visualize the aggregate values

Interactive Scalability Strategies

1. Query Database
2. Client-Side Indexing / Data Cubes
3. Prefetching
4. Approximation

These strategies are **not** mutually exclusive!
Systems can apply them in tandem.
