1.
APRIL 1854 TO MARCH 1855

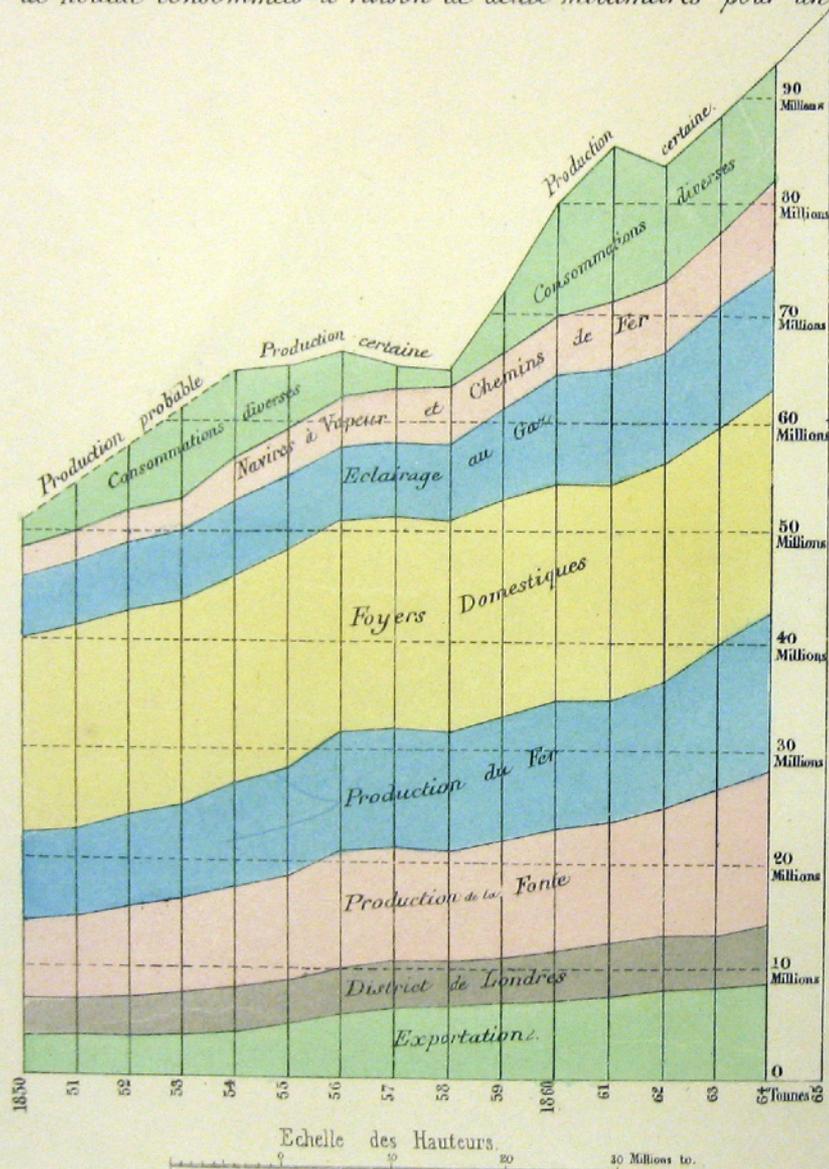

“to affect thro’ the Eyes
what we fail to convey to
the public through their
word-proof ears”

Consommations approximatives de la Houille dans la Grande Bretagne de 1850 à 1864.

Les abscisses représentent les années et les ordonnées les quantités annuelles de houille consommée.

Les couleurs indiquent les espèces de consommations. Les longueurs d'ordonnées comprises dans une couleur sont les quantités de houille consommées à raison de deux millimètres pour un million de tonnes.

Données admises pour former le Tableau ci-contre.

Consommations. — Sources des Renseignements.

Exportations. — *Mineral statistics 1865 page 214 et Renseignements Parlementaires.*

District de Londres. — *id.* — page 213

Produits de la Fonte. — *id.* — page 215 et pour les années avant 1855 calculée à raison de 3^{to} de houille pour 1^{to} de fonte, en admettant les quantités annuelles de fonte du Coal question page 192.

Production du fer — *Mineral statistics* — page 215 et pour les années avant 1855 — calculée à raison de 3^{to} 35 de houille pour 1 tonne de fonte convertie en fer, et admettant $\frac{2}{10}$ de la fonte produite convertis en fer.

Foyers domestiques. — En y comprenant les petites manufactures.

On l'estimait en 1848 à 19 millions de tonnes, (A) qu'on peut réduire à 18 millions to. pour les foyers seuls, mais qu'on peut porter à 20 millions pour la population de 1864.

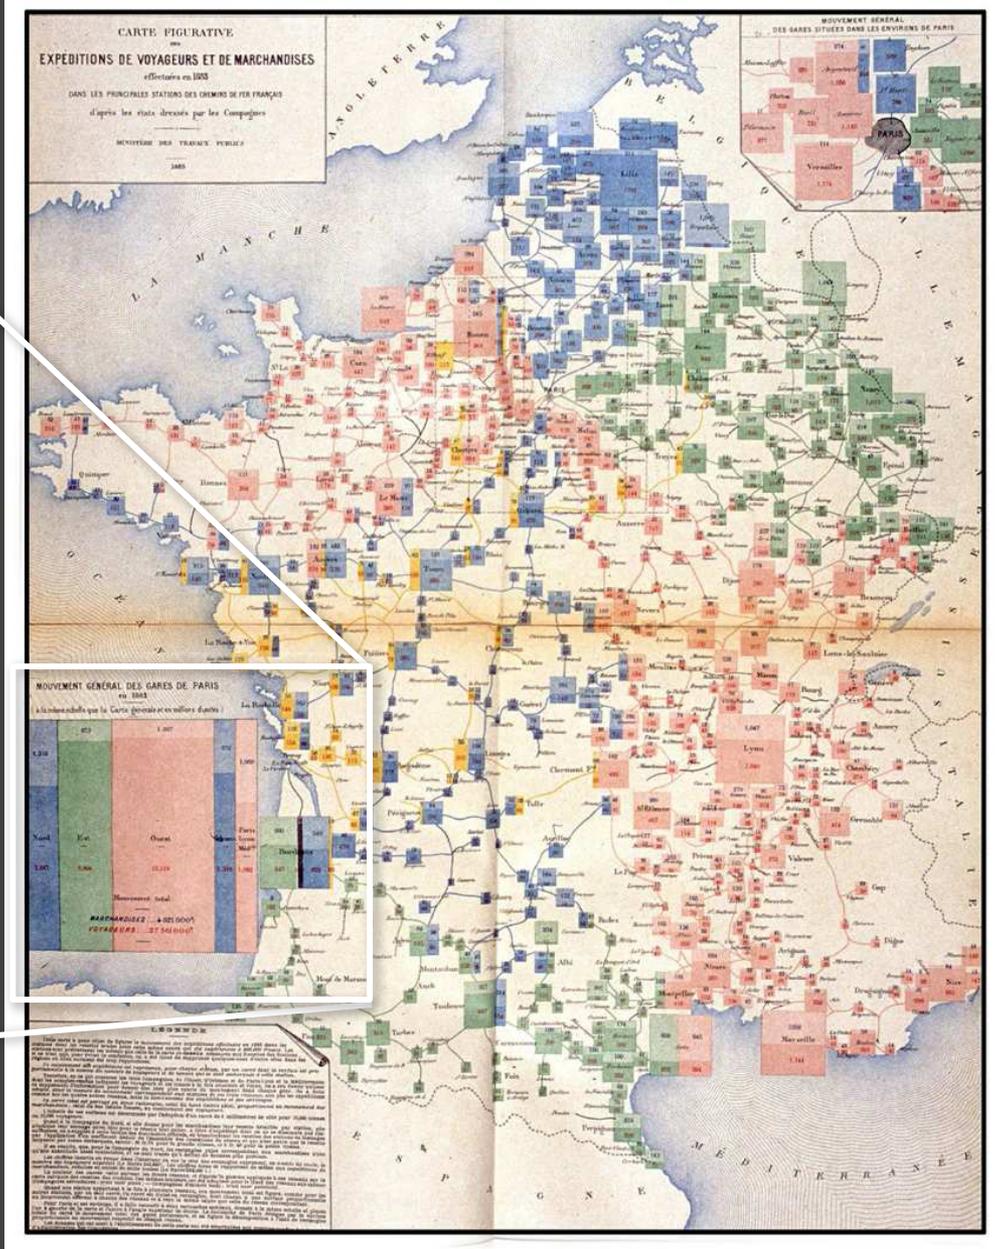

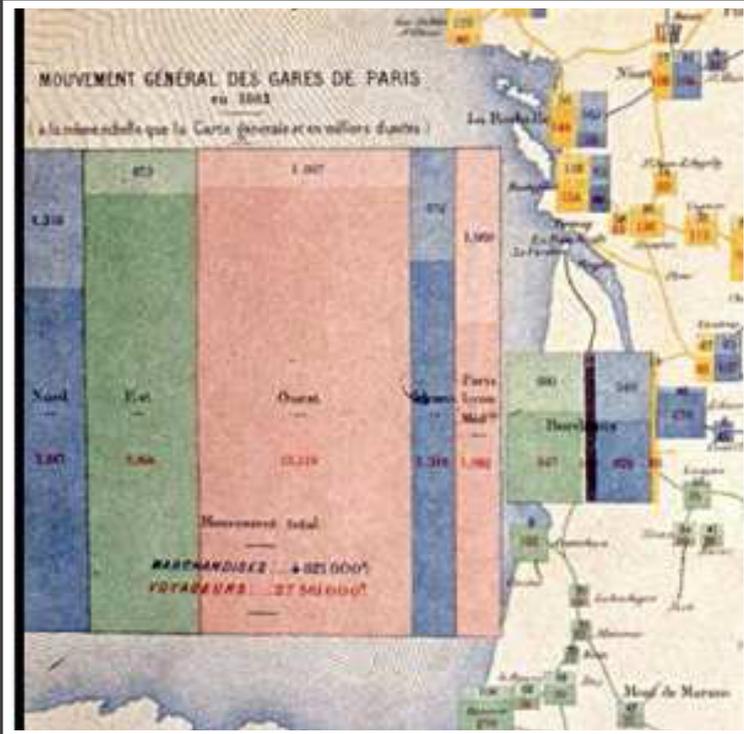

Eclairage au Gaz. — Consommation estimée généralement du $\frac{1}{3}$ au $\frac{1}{8}$ de la production totale.

Exploitation des Chemins de Fer. — En supposant pour consommation totale 10^{to} par Kilomètre parcouru par les trains d'après les renseignements parlementaires.

Navigation à vapeur. — Calculée à raison de 5^{to} houille par cheval vapeur et par heure, le nombre de chevaux étant celui du Steam Vessels pour 1864, et les steamers étant supposés marcher la moitié de l'année;

Avant 1864 j'ai supposé les consommations proportionnelles aux tonnages annuels des steamers du statistical abstract et du Board of trade.

The Rise of Statistics

1786

1900

1950

Rise of **formal statistical methods** in the physical and social sciences

Little innovation in graphical methods

A period of **application and popularization**

Graphical methods enter textbooks, curricula, and **mainstream use**

1786

1900

1950

LIFE

1786

Data Analysis & Statistics, Tukey 1962

Four major influences act on data analysis today:

1. The formal theories of statistics.
2. Accelerating developments in computers and display devices.
3. The challenge, in many fields, of more and larger bodies of data.
4. The emphasis on quantification in a wider variety of disciplines.

The last few decades have seen the rise of formal theories of statistics, "legitimizing" variation by confining it by assumption to random sampling, often assumed to involve tightly specified distributions, and restoring the appearance of security by emphasizing narrowly optimized techniques and claiming to make statements with "known" probabilities of error.

LIFE

While some of the influences of statistical theory on data analysis have been helpful, others have not.

LIFE

Exposure, the effective laying open of the data to display the unanticipated, is to us a major portion of data analysis. Formal statistics has given almost no guidance to exposure; indeed, it is not clear how the **informality** and **flexibility** appropriate to the **exploratory character of exposure** can be fitted into any of the structures of formal statistics so far proposed.

Nothing - not the careful logic of mathematics, not statistical models and theories, not the awesome arithmetic power of modern computers - nothing can substitute here for the **flexibility of the informed human mind.**

Accordingly, both approaches and techniques need to be structured so as to **facilitate human involvement and intervention.**

DataWrangler

The screenshot displays the DataWrangler interface. On the left, there are two panels: 'Suggestions' and 'Script'. The 'Suggestions' panel lists four actions: 'Delete rows 8,10', 'Delete empty rows', 'Delete rows where Property_crime_rate is null', and 'Delete rows where Year is null'. The 'Script' panel has an 'Export' button and two expandable items: 'Split data repeatedly on newline into rows' and 'Split data repeatedly on \','.

On the right, a data table is shown with 408 rows. The table has two columns: '# Year' and '# Property_crime_rate'. The data is as follows:

#	Year	#	Property_crime_rate
1	Reported crime in Alabama		
2			
3	2004		4029.3
4	2005		3900
5	2006		3937
6	2007		3974.9
7	2008		4081.9
8			
9	Reported crime in Alaska		
10			
11	2004		3370.9
12	2005		3615
13	2006		3582
14	2007		3373.9

Wrangler: Interactive Visual Specification of Data Transformation Scripts

Sean Kandel et al. *CHI'11*

Data Wrangling

One often needs to manipulate data prior to analysis. Tasks include reformatting, cleaning, quality assessment, and integration.

Approaches include:

Manual manipulation in spreadsheets

Code: arquero (JS), dplyr (R), pandas (Python)

Trifacta Wrangler <http://www.trifacta.com/products/wrangler/>

Open Refine <http://openrefine.org/>

Tidy Data [Wickham 2014]

How do rows, columns, and tables match up with observations, variables, and types? In “tidy” data:

1. Each variable forms a column.
2. Each observation forms a row.
3. Each type of observational unit forms a table.

The advantage is that this provides a flexible starting point for analysis, transformation, and visualization.

Our pivoted table variant was not “tidy”!

(This is a variant of normalized forms in DB theory)

Data Quality

"The first sign that a visualization is good is that it shows you a problem in your data...

...every successful visualization that I've been involved with has had this stage where you realize, "Oh my God, this data is not what I thought it would be!" So already, you've discovered something."

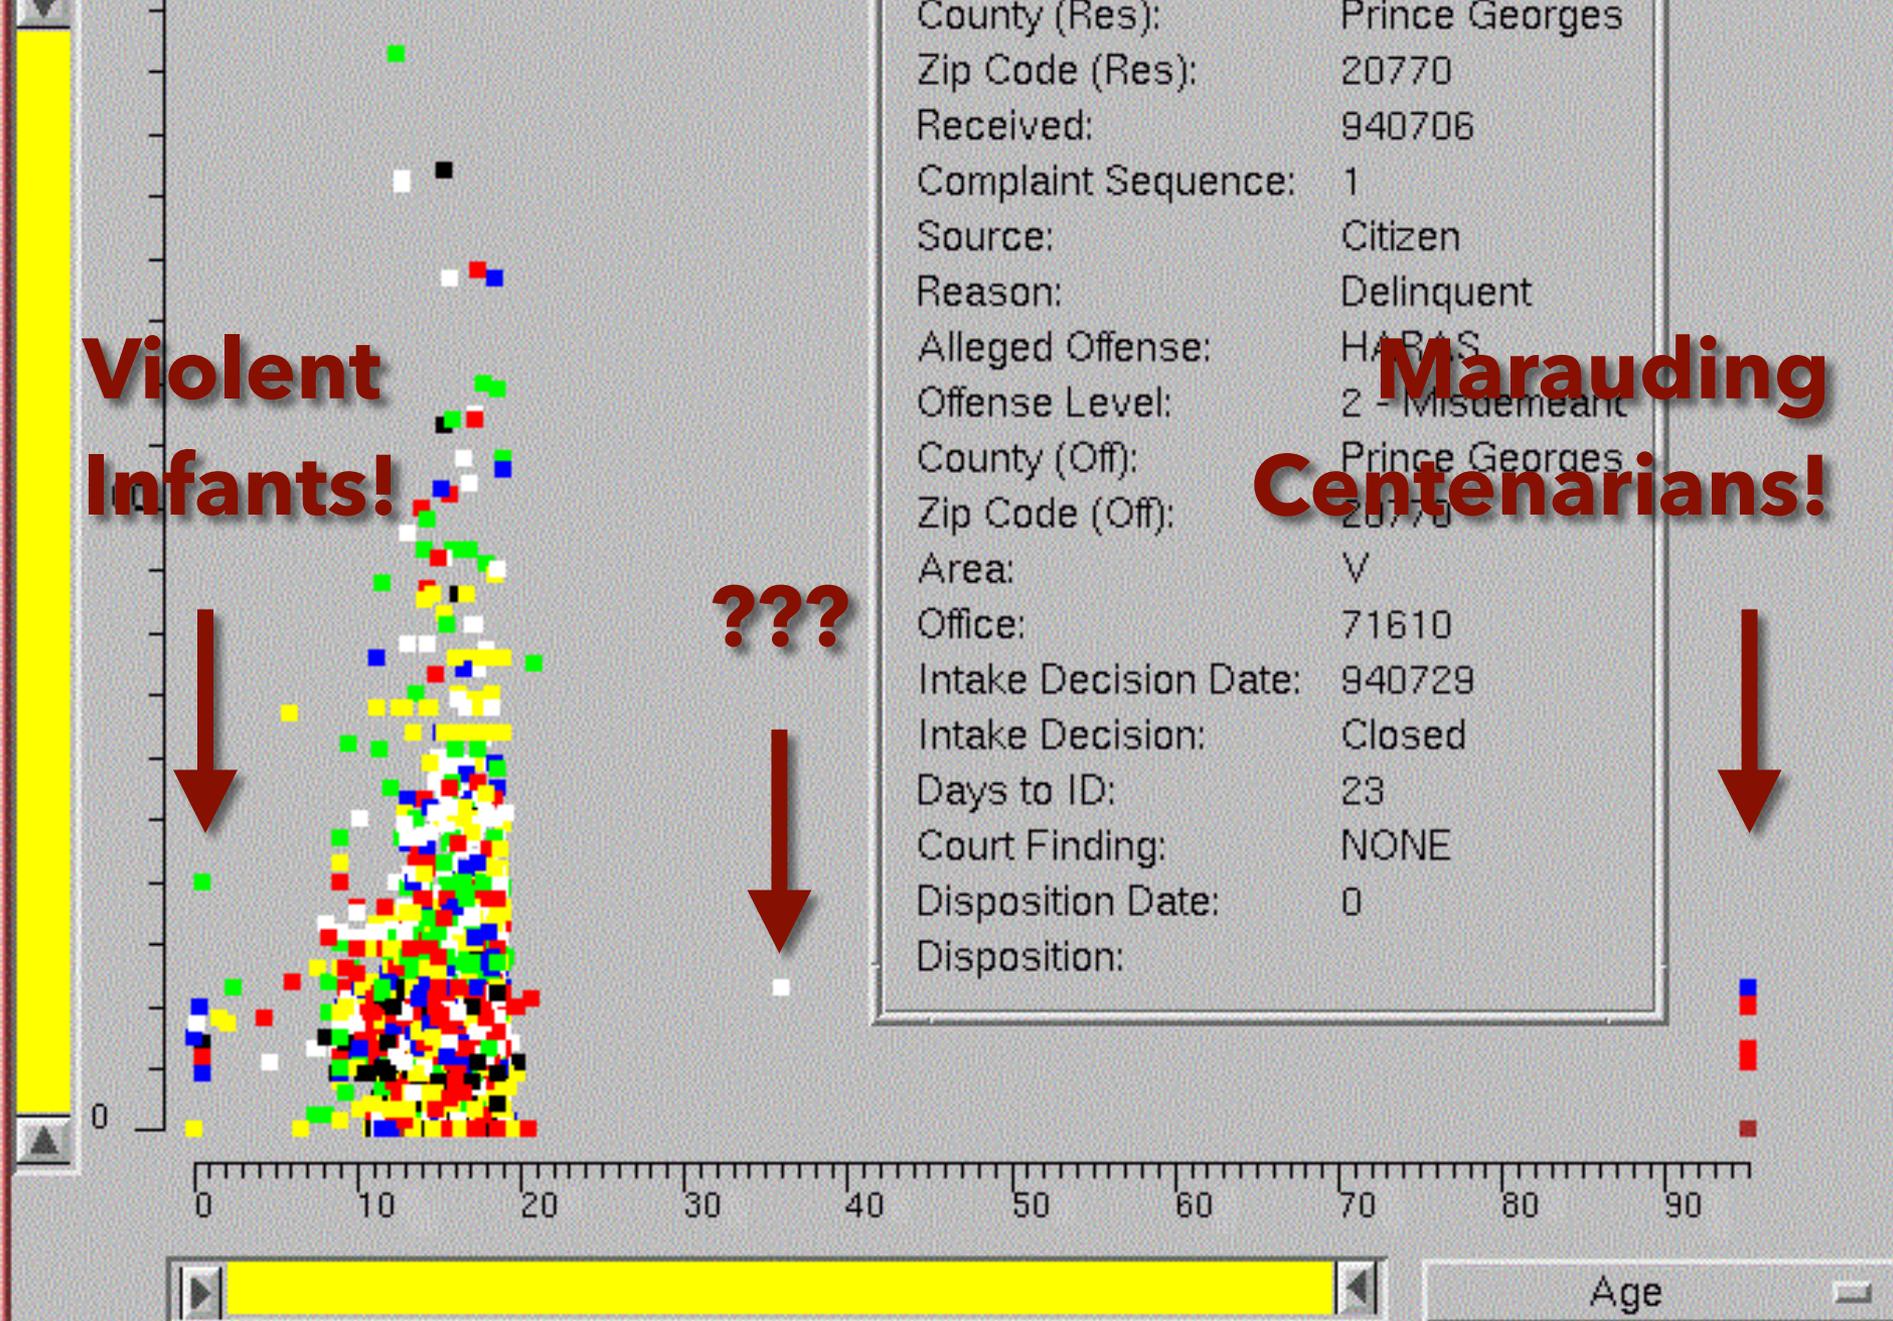

Martin Wattenberg

County (Res): Prince Georges

Data Quality Hurdles

Missing Data	no measurements, redacted, ...?
Erroneous Values	misspelling, outliers, ...?
Type Conversion	e.g., zip code to lat-lon
Entity Resolution	diff. values for the same thing?
Data Integration	effort/errors when combining data

LESSON: Anticipate problems with your data.
Many research problems around these issues!

Administrivia

A2: Deceptive Visualization

Design **two** static visualizations for a dataset:

1. An *earnest* visualization that faithfully conveys the data
2. A *deceptive* visualization that tries to mislead viewers

Your two visualizations may address different questions.

Try to design a deceptive visualization that appears to be earnest: *can you trick your classmates and course staff?*

You are free to choose your own dataset, but we have also provided some preselected datasets for you.

Submit two images and a brief write-up on Canvas.

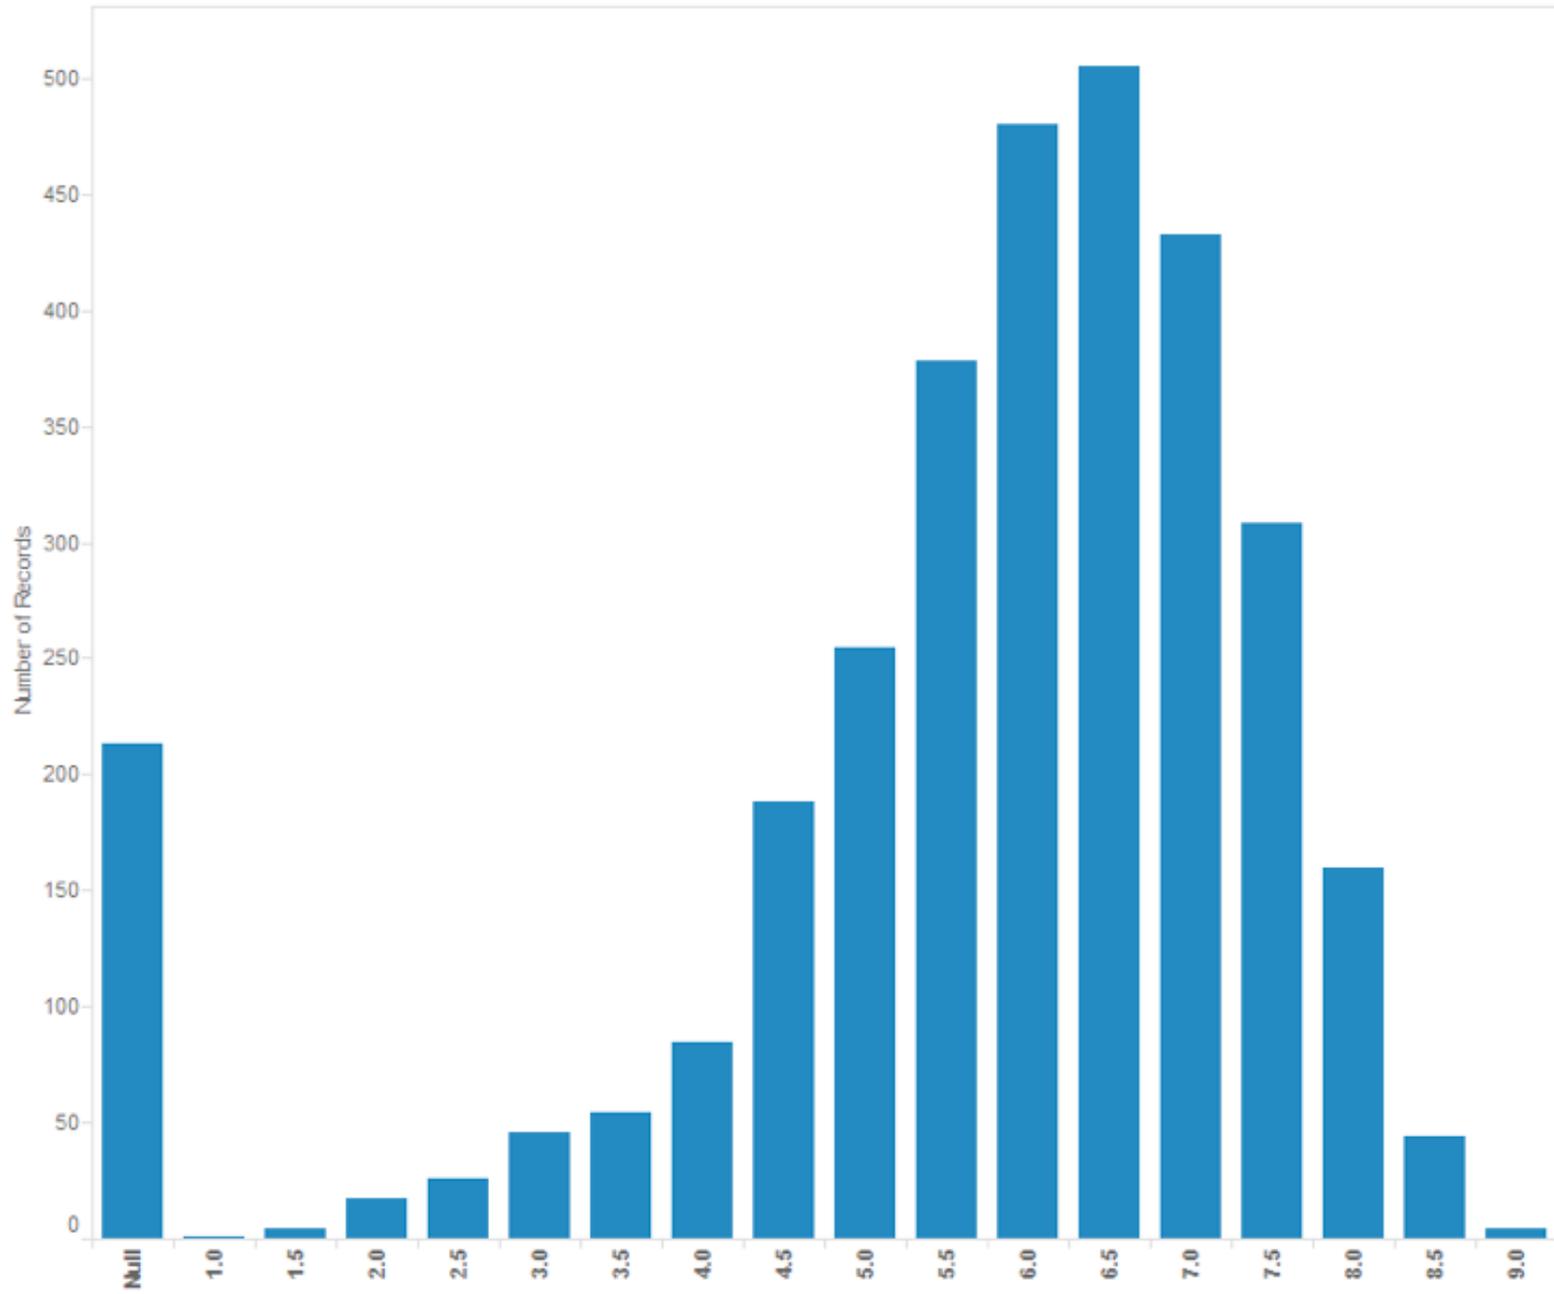

Due by **Wed 1/26 11:59pm**.

Analysis Example: Motion Pictures Data

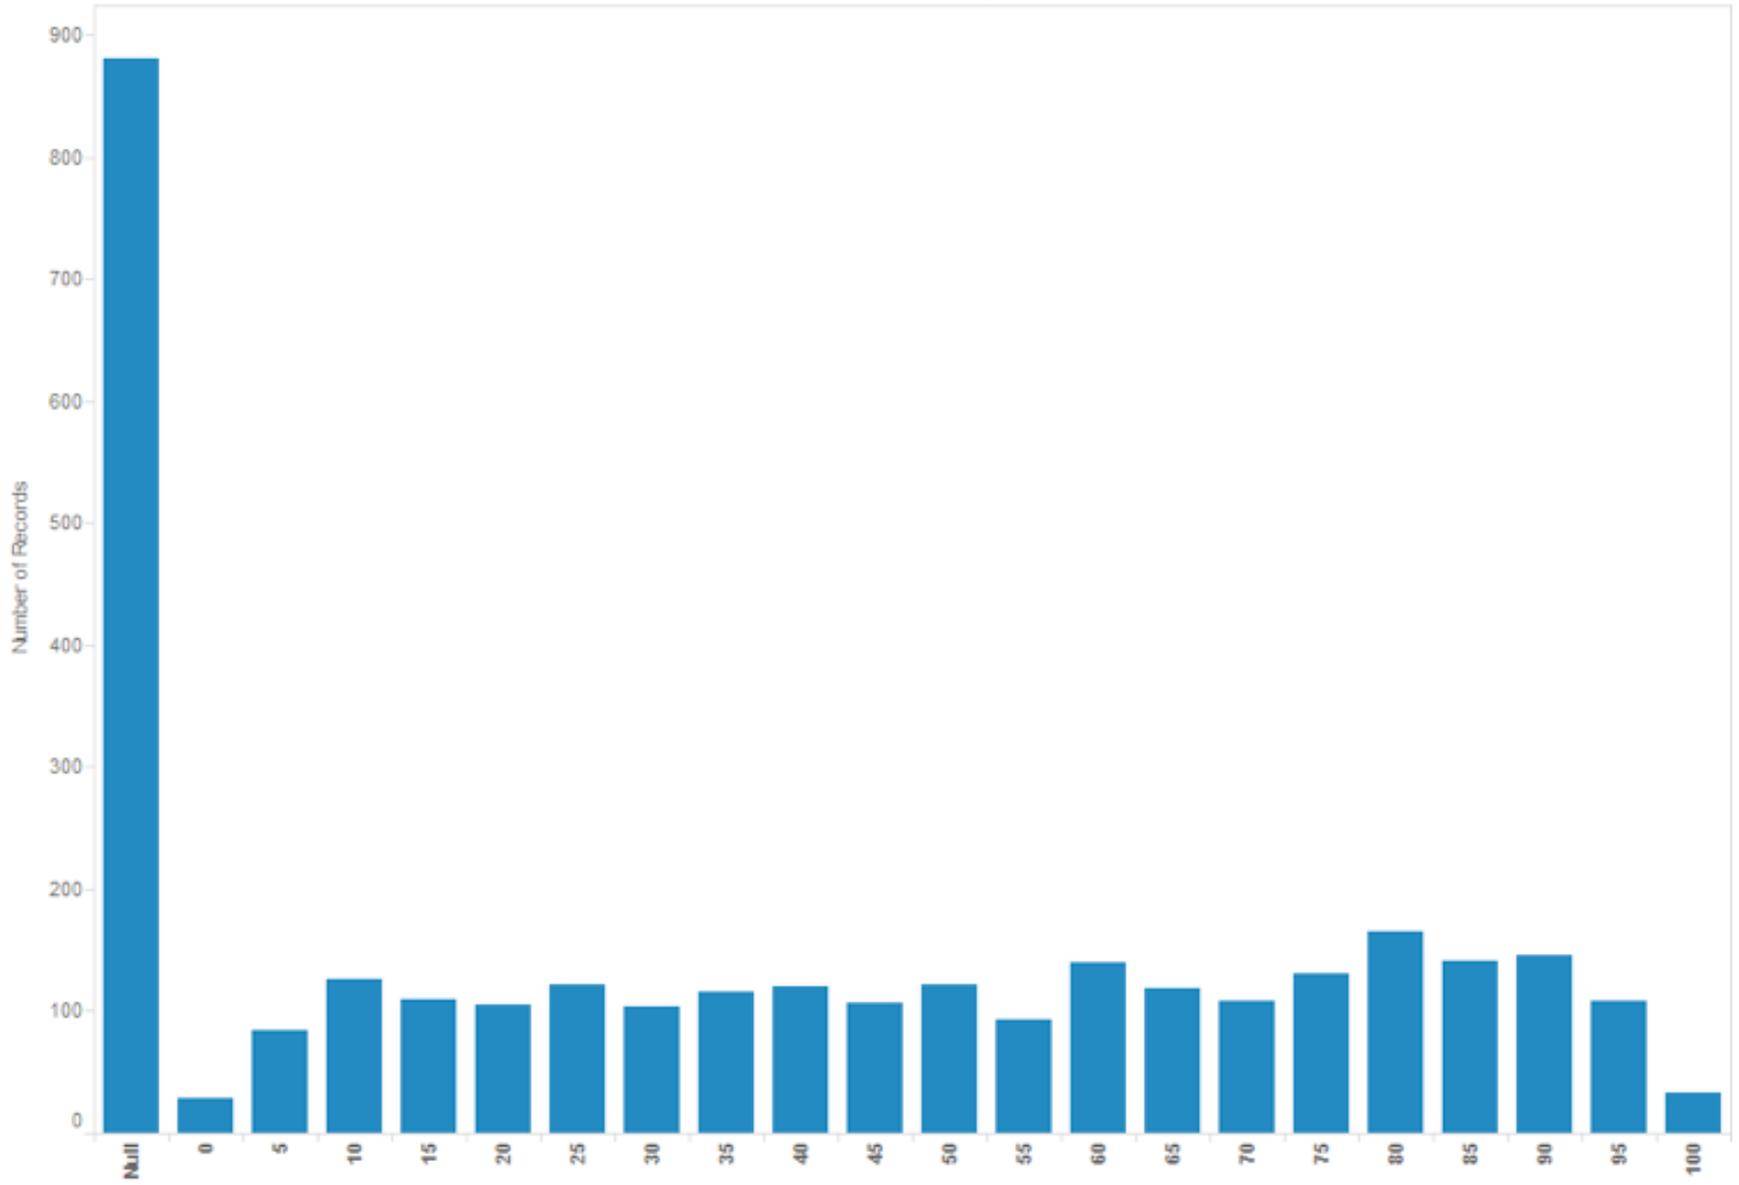

Motion Pictures Data

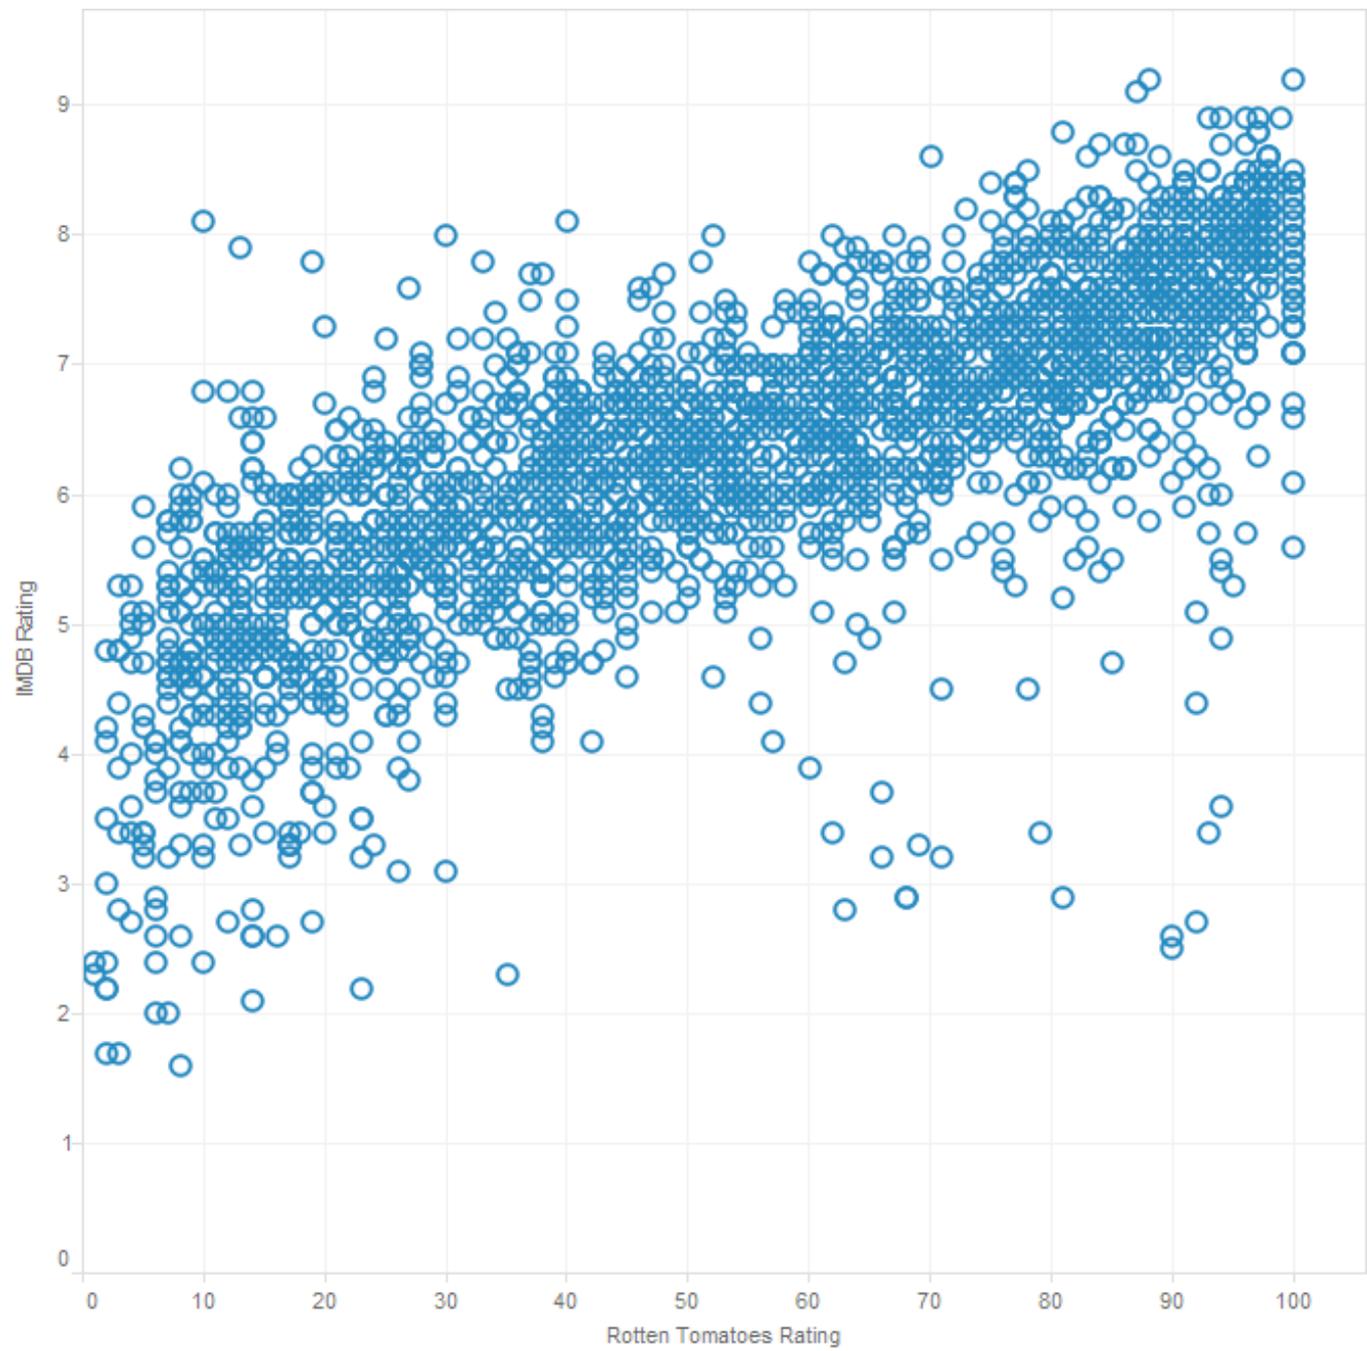

Title	String (N)
IMDB Rating	Number (Q)
Rotten Tomatoes Rating	Number (Q)
MPAA Rating	String (O)
Release Date	Date (T)

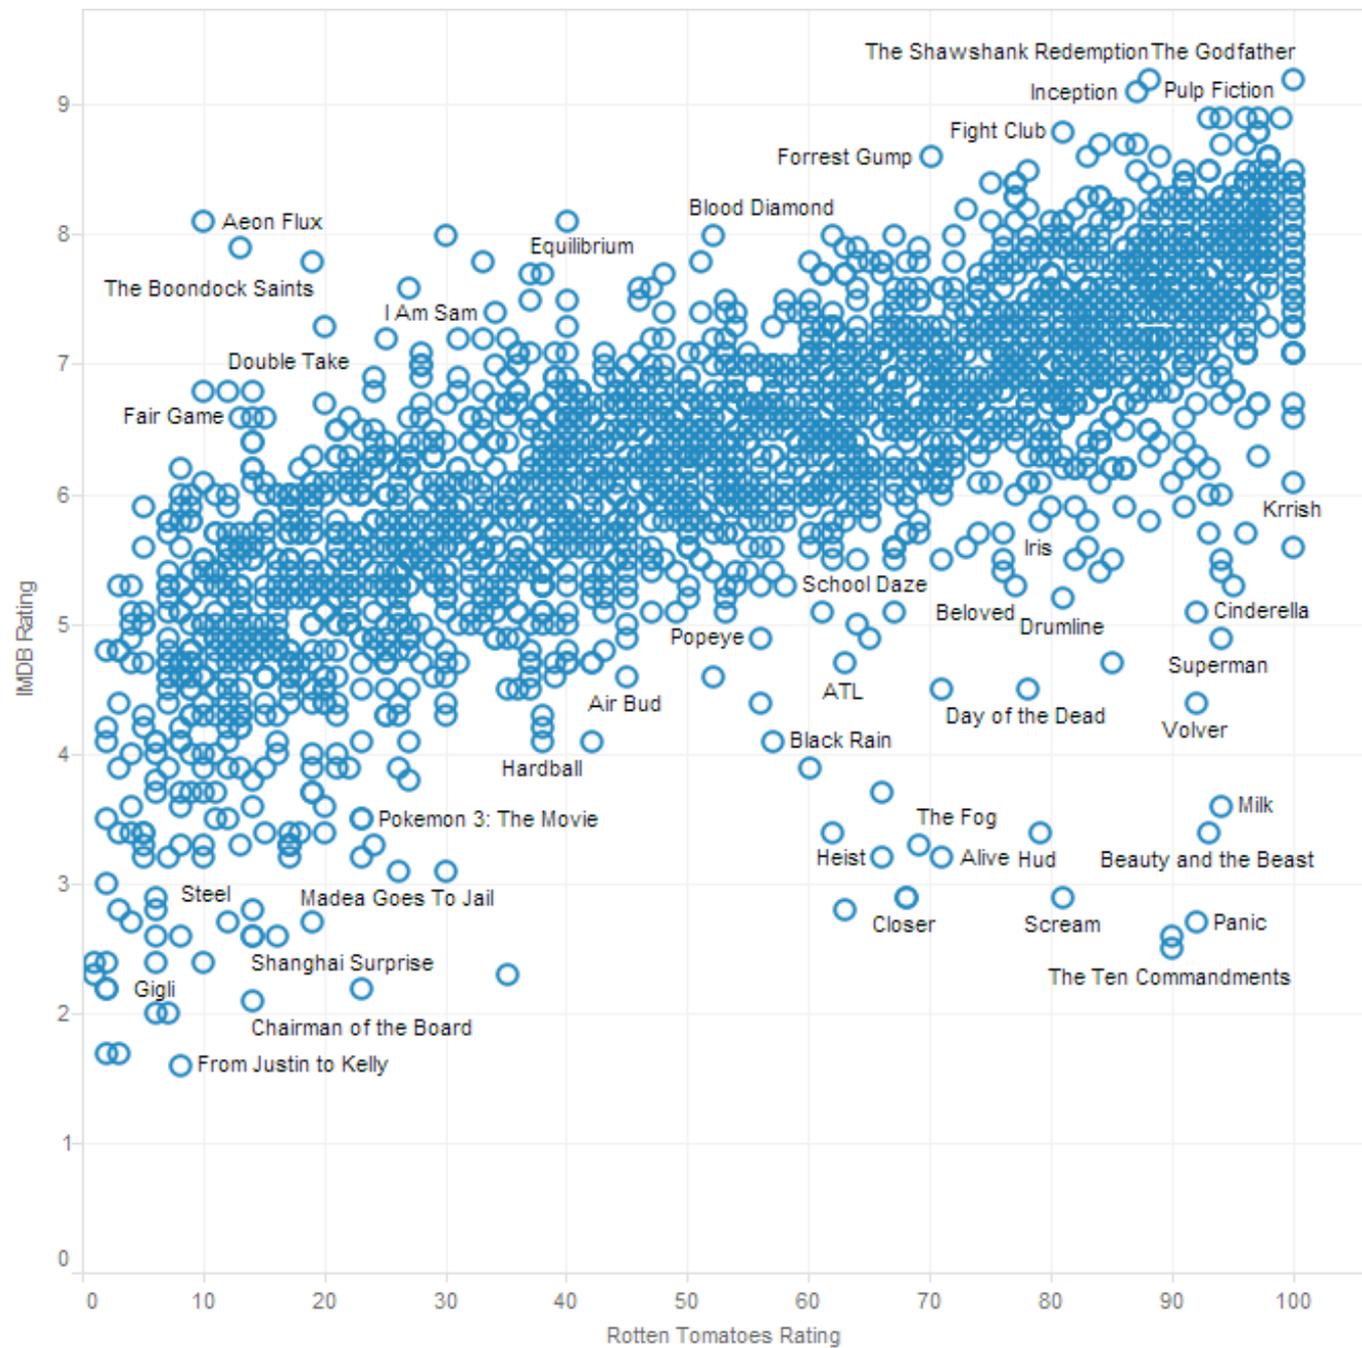

IMDB Rating (bin)

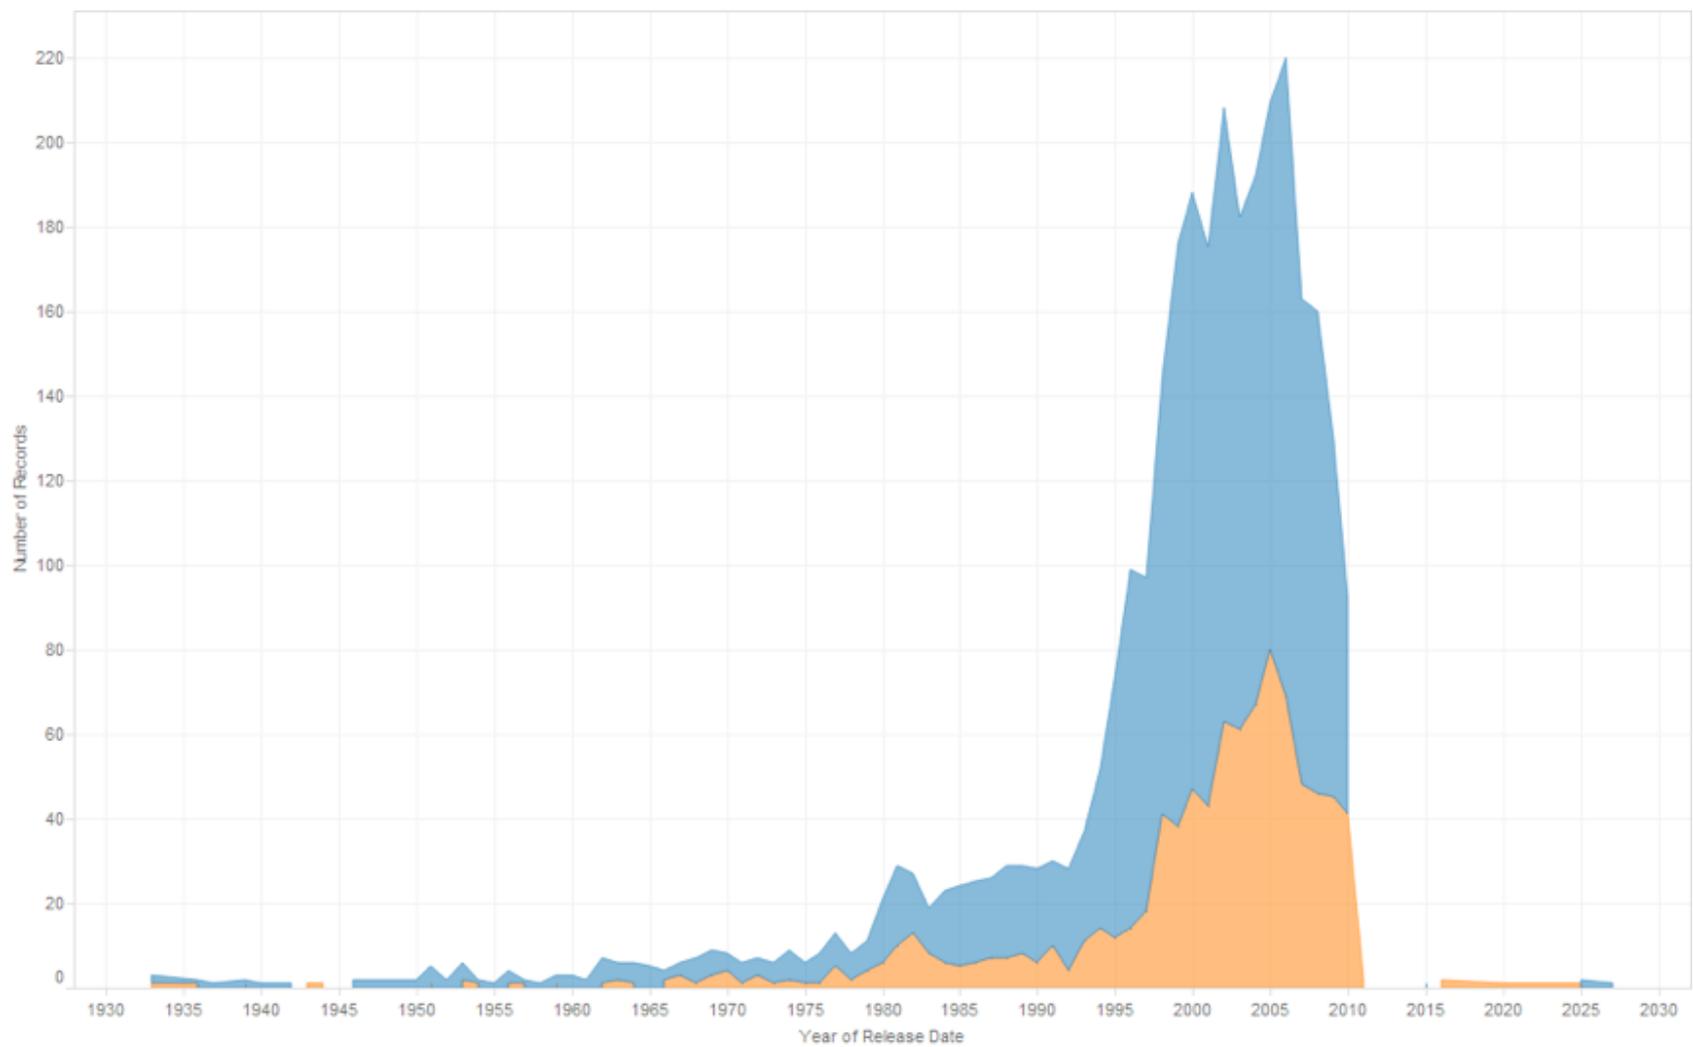

Rotten Tomatoes Rating (bin)

Lesson: Exercise Skepticism

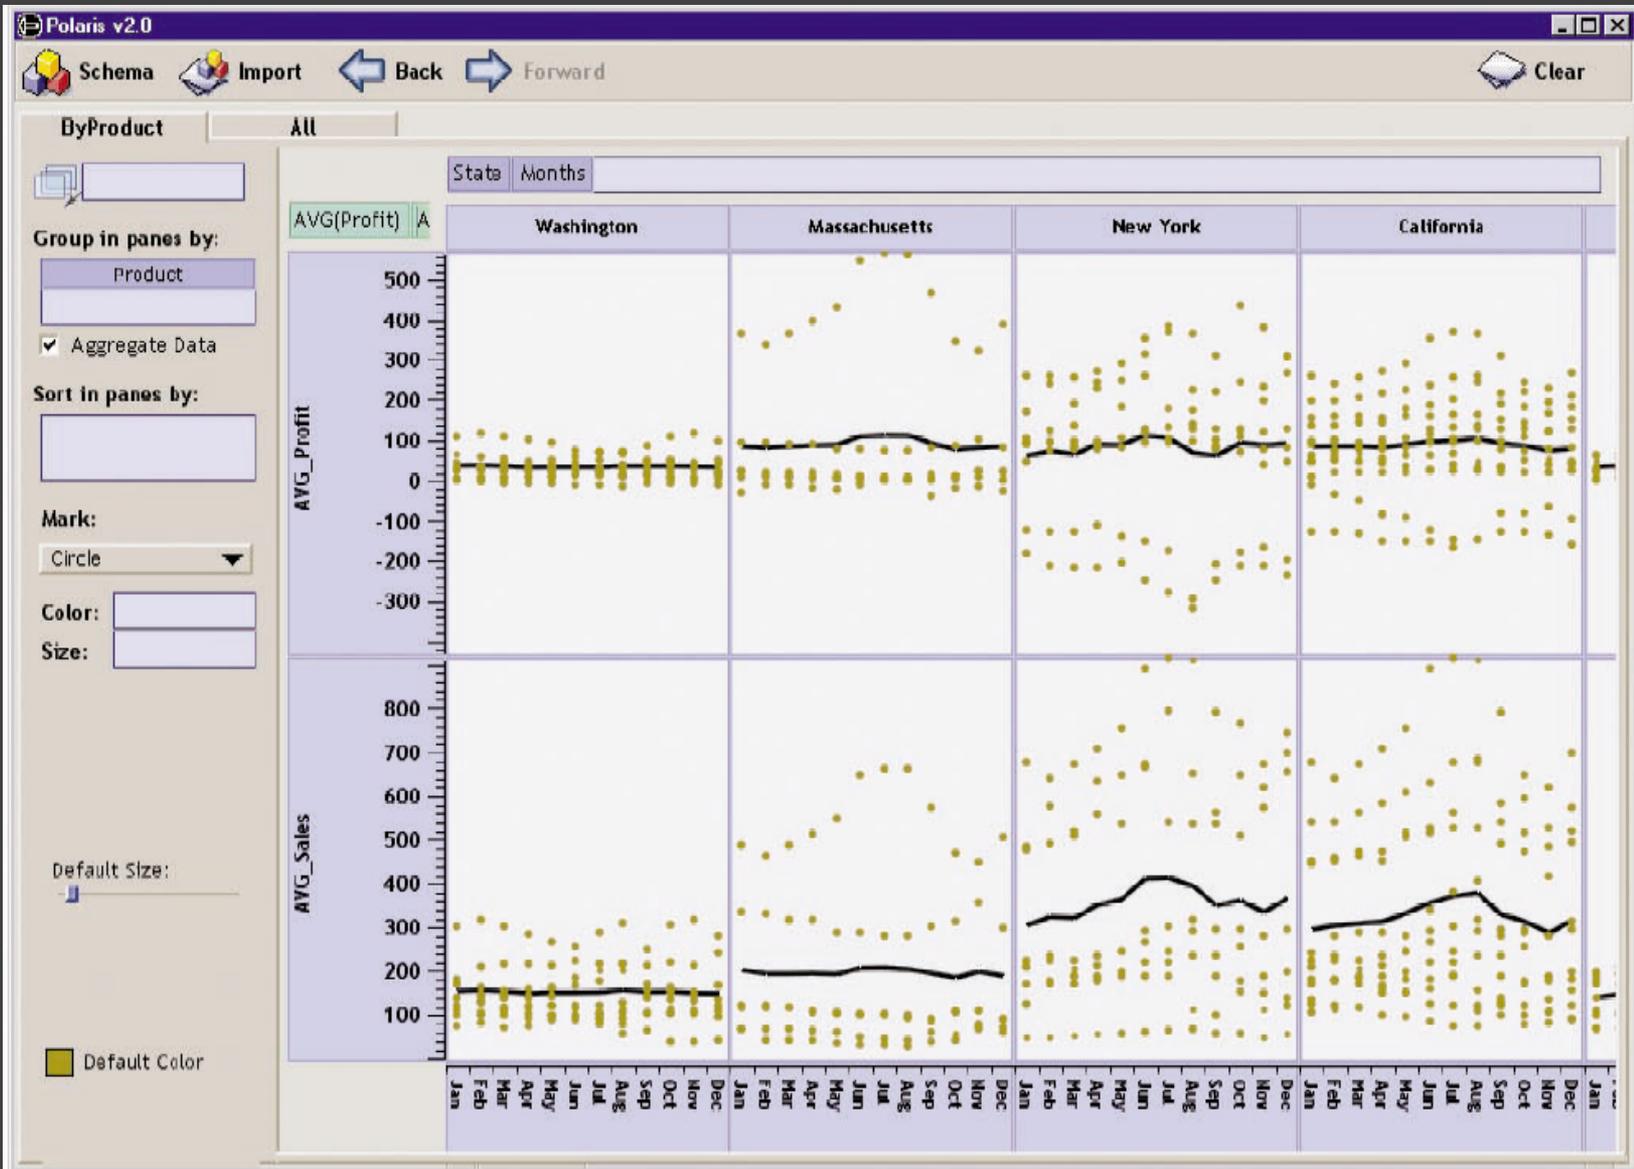

Check **data quality** and your **assumptions**.

Start with **univariate summaries**, then start to consider **relationships among variables**.

Avoid premature fixation!

Tableau / Polaris

Polaris [Stolte et al.]

Tableau

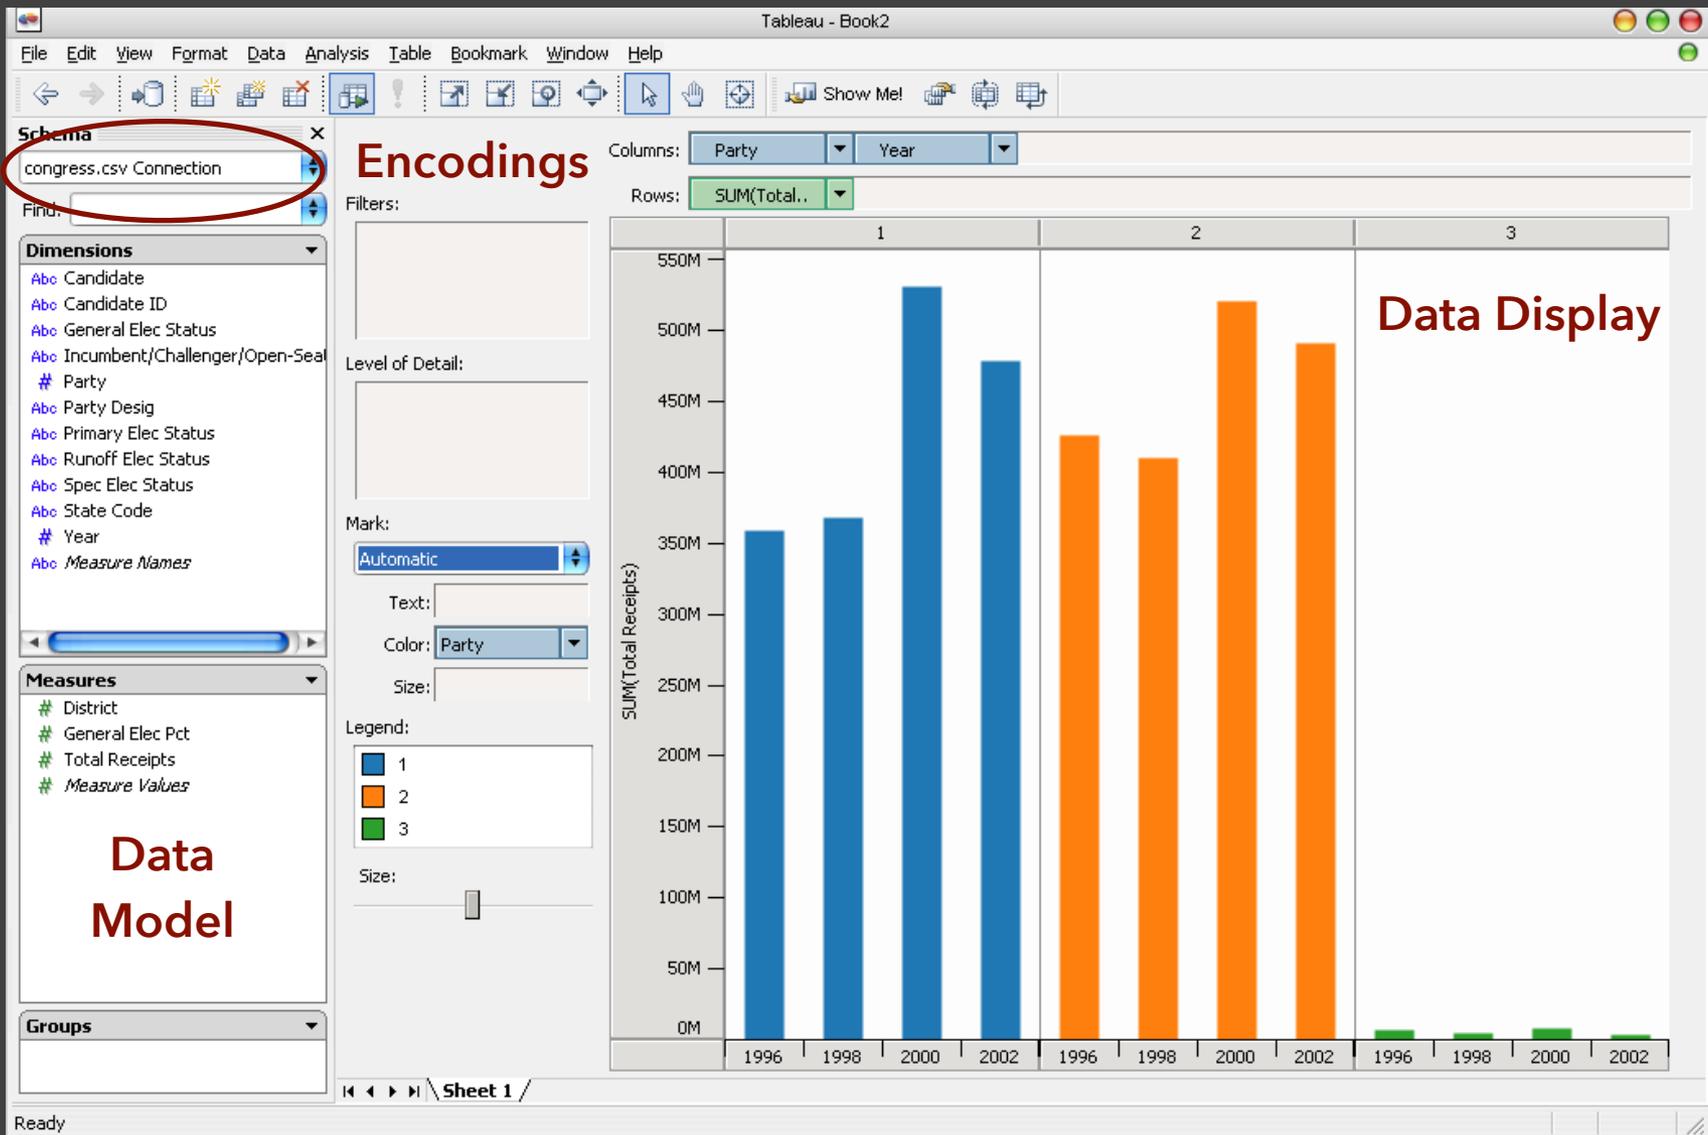

Tableau / Polaris Approach

Insight: can simultaneously specify both database queries and visualization

Choose data, then visualization, not vice versa

Use smart defaults for visual encodings

Can also suggest encodings upon request

Tableau Demo

The dataset:

Federal Elections Commission Receipts

Every Congressional Candidate from 1996 to 2002

4 Election Cycles

9216 Candidacies

Dataset Schema

Year (Qi)

Candidate Code (N)

Candidate Name (N)

Incumbent / Challenger / Open-Seat (N)

Party Code (N) [1=Dem,2=Rep,3=Other]

Party Name (N)

Total Receipts (Qr)

State (N)

District (N)

This is a subset of the larger data set available from the FEC.

Hypotheses?

What might we learn from this data?

Hypotheses?

What might we learn from this data?

Correlation between receipts and winners?

Do receipts increase over time?

Which states spend the most?

Which party spends the most?

Margin of victory vs. amount spent?

Amount spent between competitors?

Tableau Demo

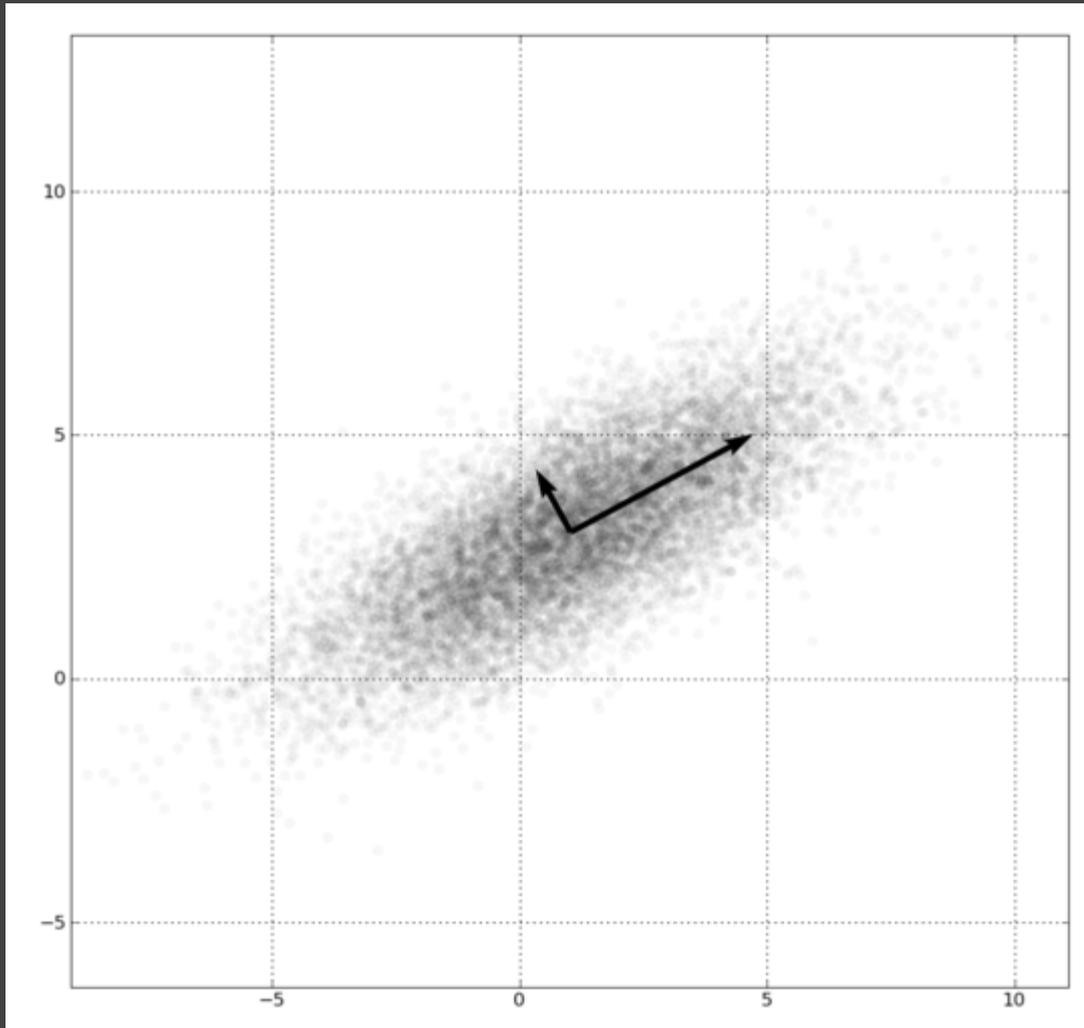

Dimensionality Reduction

Dimensionality Reduction (DR)

Project nD data to 2D or 3D for viewing. Often used to interpret and sanity check high-dimensional representations fit by machine learning methods.

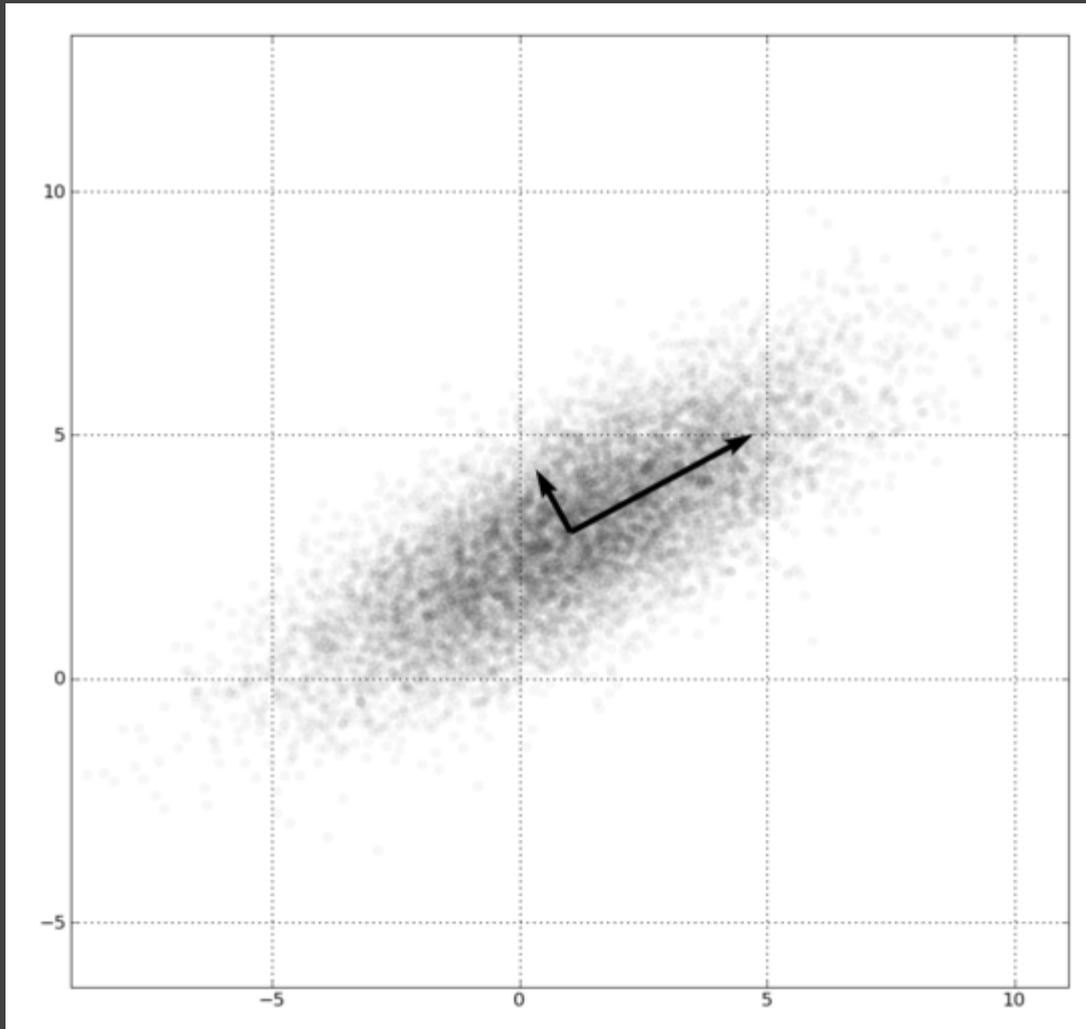

Different DR methods make different trade-offs: for example to **preserve global structure** (e.g., PCA) or **emphasize local structure** (e.g., nearest-neighbor approaches, including t-SNE and UMAP).

Principal Components Analysis

1. Mean-center the data.
2. Find \perp basis vectors that maximize the data variance.
3. Plot the data using the top vectors.

Principal Components Analysis

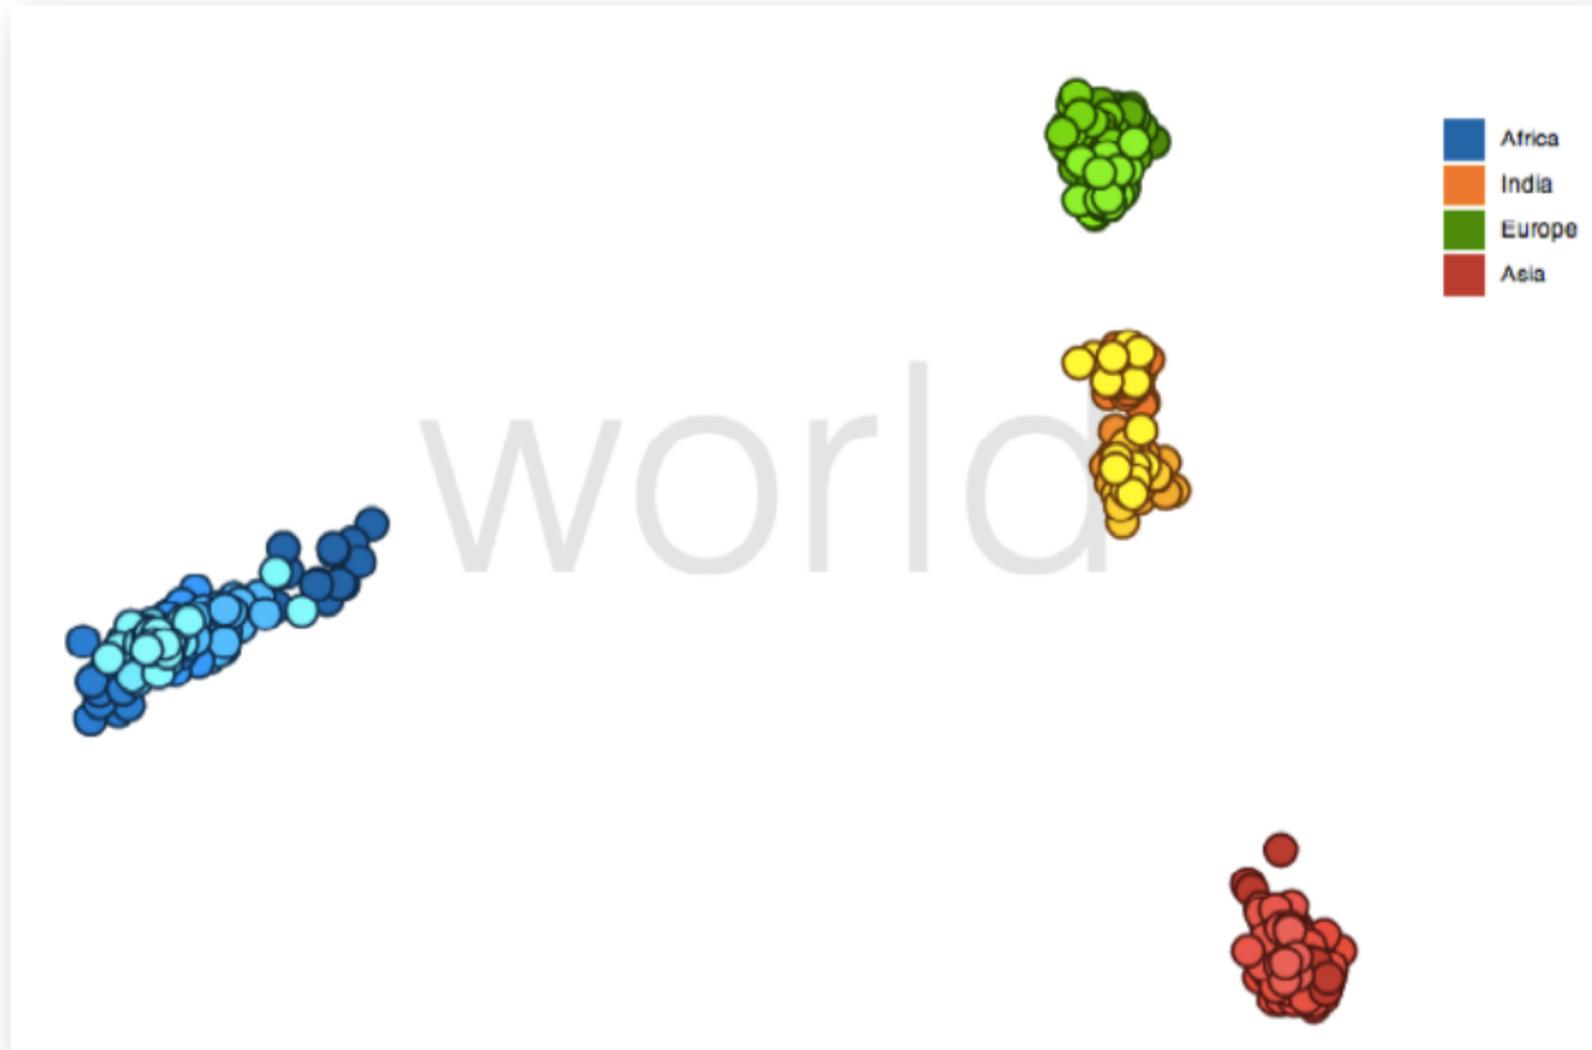

Linear transform:
scale and rotate
original space.

Lines (vectors)
project to lines.

Preserves global
distances.

PCA of Genomes [Demiralp et al. '13]

Reduction Techniques

LINEAR - PRESERVE GLOBAL STRUCTURE

Principal Components Analysis (PCA)

Linear transformation of basis vectors, ordered by amount of data variance they explain.

NON-LINEAR - PRESERVE LOCAL TOPOLOGY

t-Dist. Stochastic Neighbor Embedding (t-SNE)

Probabilistically model distance, optimize positions.

Uniform Manifold Approx. & Projection (UMAP)

Identify local manifolds, then stitch them together.

Non-Linear Techniques

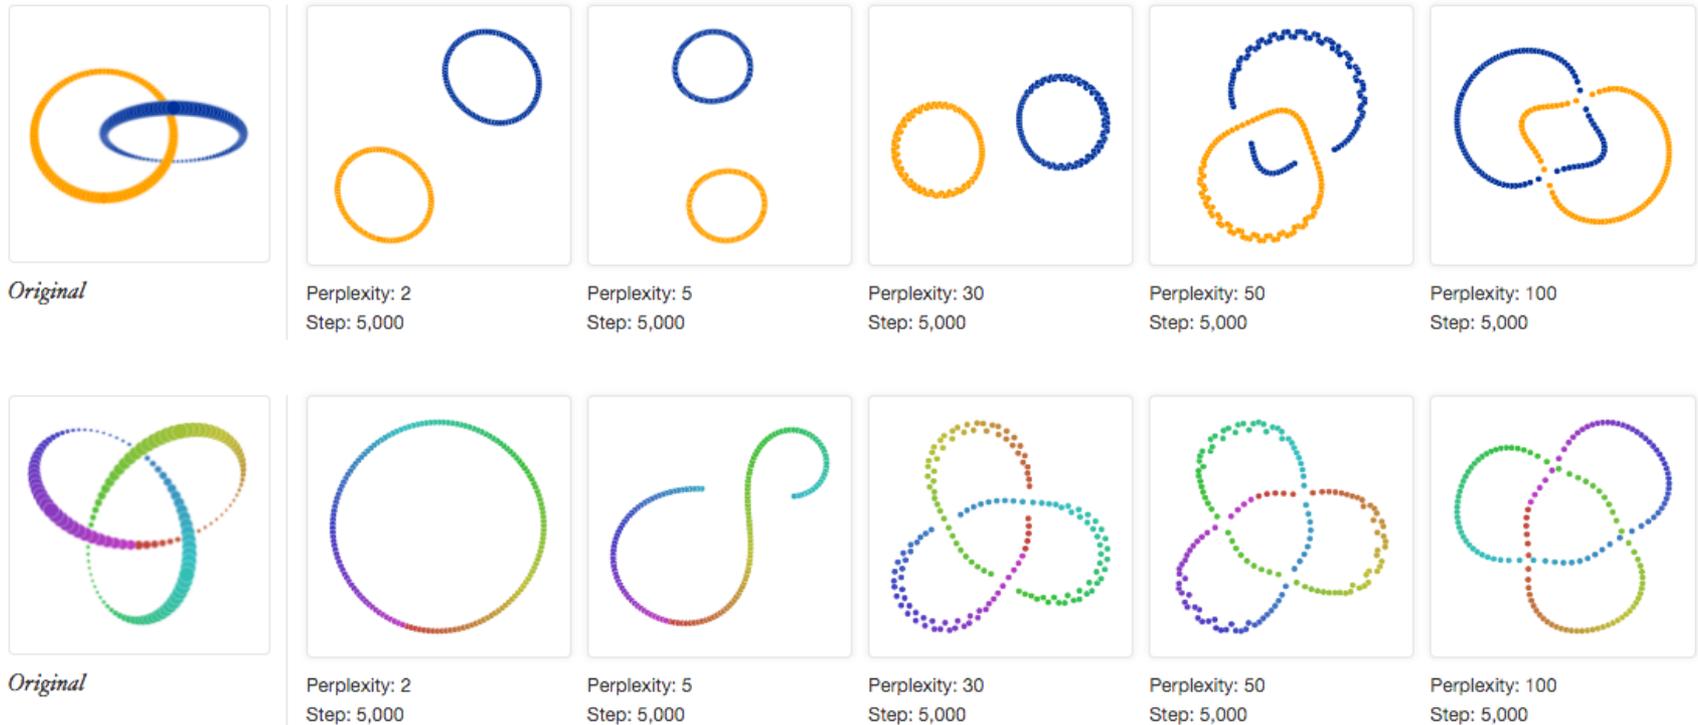

Distort the space, trade-off preservation of global structure to emphasize local neighborhoods. Use topological (nearest neighbor) analysis.

Two popular contemporary methods:

t-SNE - probabilistic interpretation of distance

UMAP - tries to balance local/global trade-off

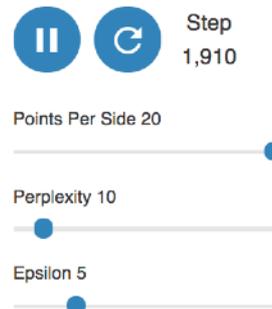

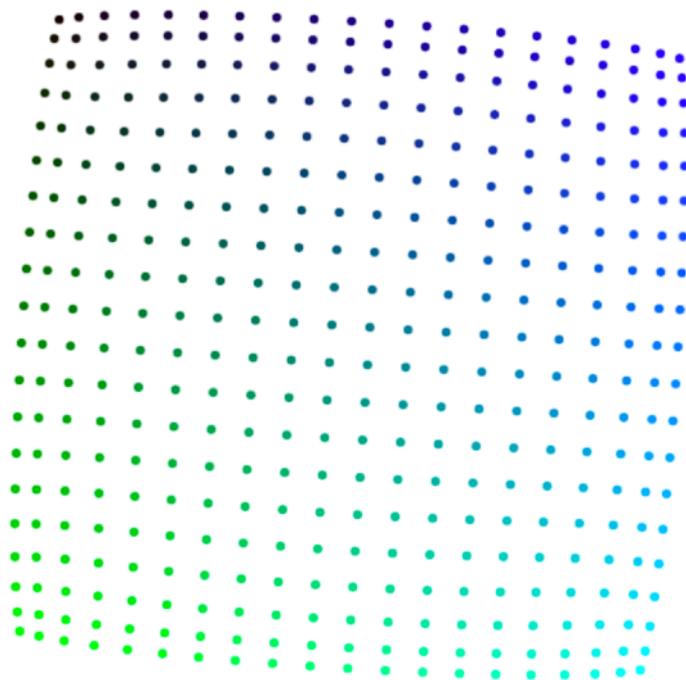

Visualizing t-SNE [Wattenberg et al. '16]

Results can be highly sensitive to the algorithm parameters!
Are you seeing real structures, or algorithmic hallucinations?

How to Use t-SNE Effectively

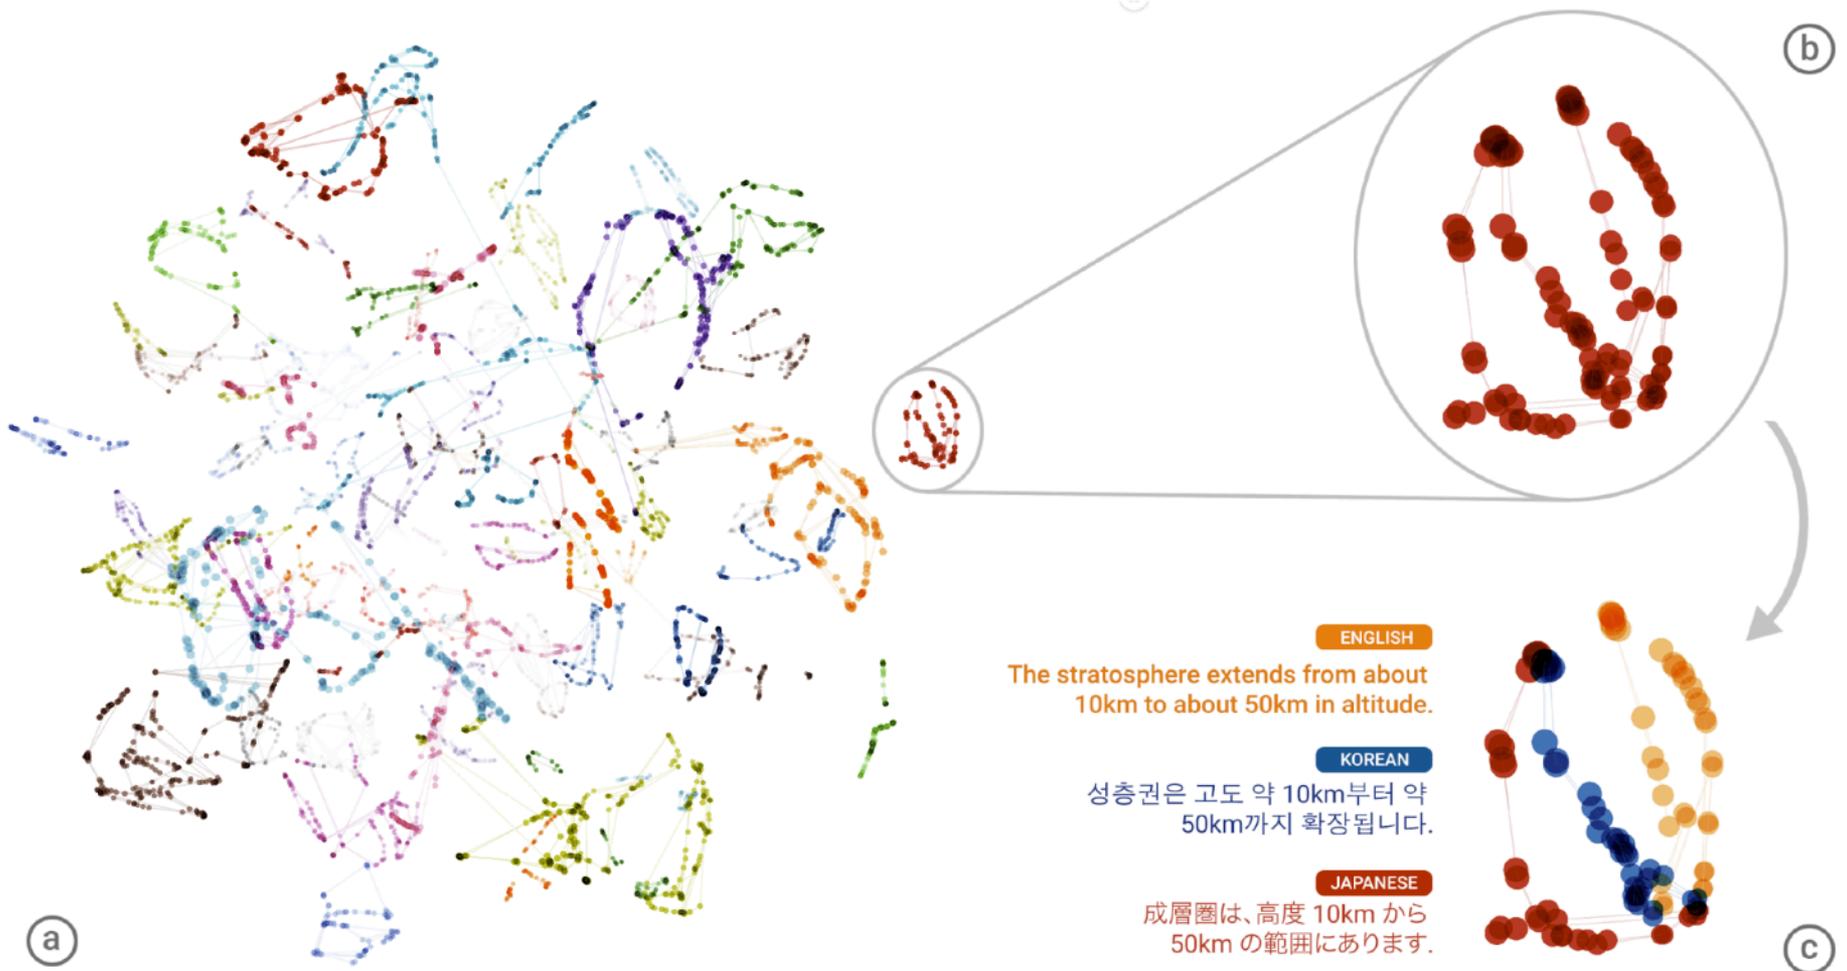

Although extremely useful for visualizing high-dimensional data, t-SNE plots can sometimes be mysterious or misleading. By exploring how it behaves in simple cases, we can learn to use it more effectively.

A square grid with equal spacing between points. Try convergence at different sizes.

distill.pub

MT Embedding [Johnson et al. 2018]

t-SNE projection of latent space of language translation model.

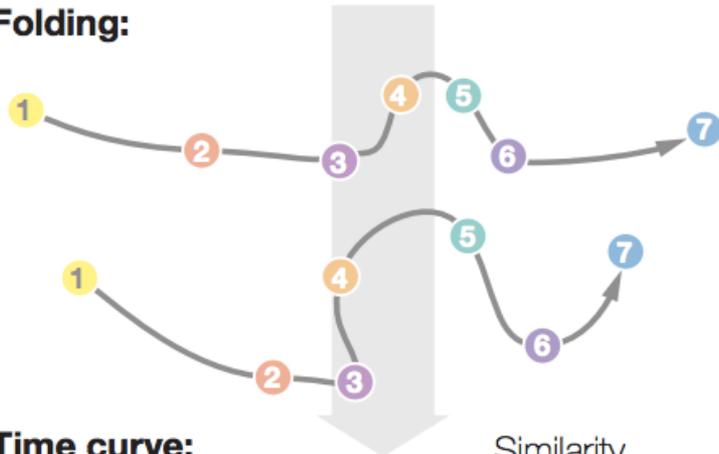

Time Curves [Bach et al. '16]

Timeline:

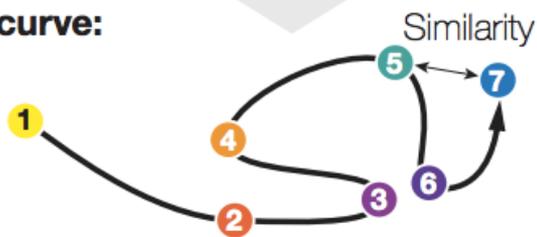

Circles are data cases with a time stamp.
Similar colors indicate similar data cases.

Folding:

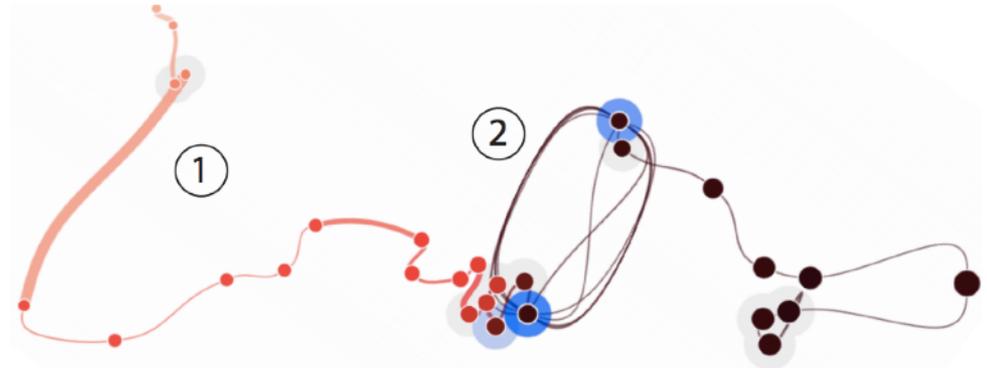

Time curve:

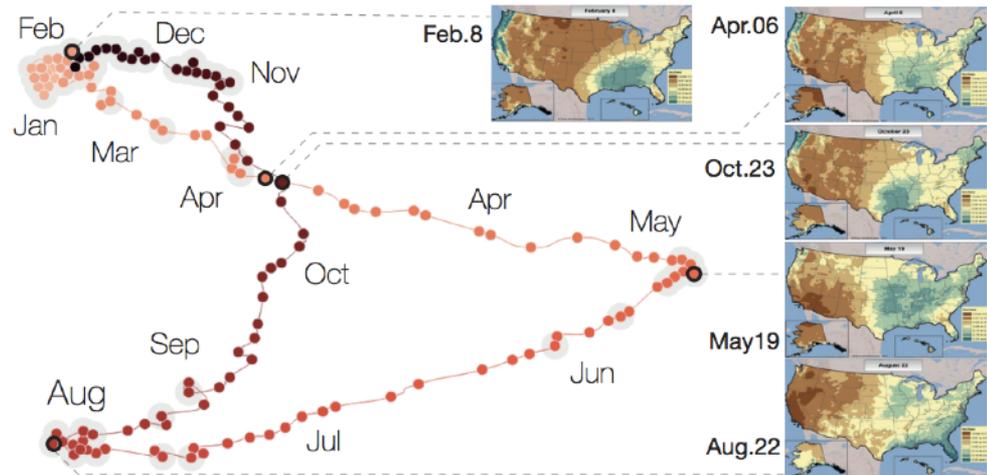

The temporal ordering of data cases is preserved.
Spatial proximity now indicates similarity.
