

CSE 451: Operating Systems Winter 2006

Module 1 Course Introduction

Ed Lazowska
lazowska@cs.washington.edu
570 Allen Center

Today's agenda

- Administrivia
 - course overview
 - course staff
 - general structure
 - the text
 - policies
 - your to-do list
 - course registration
- OS overview
 - functional
 - resource management, etc.
 - historical
 - batch systems, multiprogramming, timeshared OS's
 - PCs, networked computers, p2p, embedded systems

1/15/2006

© 2006 Gribble, Lazowska, Levy

2

Course overview

- Everything you need to know will be on the course web page:

<http://www.cs.washington.edu/451/>

1/15/2006

© 2006 Gribble, Lazowska, Levy

3

- But to tide you over for the next hour ...

- course staff
 - Ed Lazowska
 - Kurtis Heimerl
 - Lillie Kittredge
- general structure
 - read the text prior to class
 - class will supplement rather than regurgitate the text
 - homework exercises provide added impetus to keep up with the reading
 - sections will focus on the project (5 components)
 - we really want to encourage *discussion*, both in class and in section

1/15/2006

© 2006 Gribble, Lazowska, Levy

4

- the text
 - Silberschatz, Galvin & Gagne, *Operating System Concepts*, **seventh edition**
 - if using an earlier edition, watch chapter numbering, exercise numbering
- policies
 - collaboration vs. cheating
 - homework exercises
 - late policy

1/15/2006

© 2006 Gribble, Lazowska, Levy

5

- your to-do list ...
 - please read the entire course web thoroughly, *today*
 - please get yourself on the cse451 email list, *today*, and check your email *daily*
 - homework 1 (reading + problems) is posted on the web now; reading due Friday, problems due at **the start of class** on Monday
 - project 0 is posted on the web now; will be discussed in section on Thursday; due at **the start of class** next Wednesday (but if you don't get started this week you'll be in trouble)

1/15/2006

6

Course registration

- If you're going to drop this course
 - please do it soon!
- If you want to get into this course
 - plan for the worst case (we're over our limit of 60 currently)
 - but, make sure you've filed a petition with the advisors
 - Crystal, Megan, and Monica run the show!

7

What is an Operating System?

- The text:
 - “an intermediary between the user of a computer and the computer hardware”
 - “manages the computer hardware”
 - “each [piece] should be ... well delineated ..., with carefully defined inputs, outputs, and functions”
 - “an amazing aspect of operating systems is how varied they are in accomplishing these tasks ... mainframe operating systems ... personal computer operating systems ... operating systems for handheld computers ...”
 - “in 1998, the United States Department of Justice filed suit against Microsoft, in essence claiming that Microsoft included too much functionality in its operating system ... for example, a web browser was an integral part of the operating system”

1/15/2006

8

What is an Operating System?

- An operating system (OS) is:
 - a software layer to abstract away and manage details of hardware resources
 - a set of utilities to simplify application development

- “all the code you didn't write” in order to implement your application

13

The OS and hardware

- An OS **mediates** programs' access to hardware resources
 - Computation (CPU)
 - Volatile storage (memory) and persistent storage (disk, etc.)
 - Network communications (TCP/IP stacks, Ethernet cards, etc.)
 - Input/output devices (keyboard, display, sound card, etc.)
- The OS **abstracts** hardware into **logical resources** and well-defined **interfaces** to those resources
 - processes (CPU, memory)
 - files (disk)
 - sockets (network)

1/15/2006

© 2006 Gribble, Lazowska, Levy

14

Why bother with an OS?

- Application benefits
 - programming **simplicity**
 - see high-level abstractions (files) instead of low-level hardware details (device registers)
 - abstractions are **reusable** across many programs
 - **portability** (across machine configurations or architectures)
 - device independence: 3Com card or Intel card?
- User benefits
 - **safety**
 - program "sees" own virtual machine, thinks it owns computer
 - OS **protects** programs from each other
 - OS **fairly multiplexes** resources across programs
 - **efficiency** (cost and speed)
 - **share** one computer across many users
 - **concurrent** execution of multiple programs

1/15/2006

© 2006 Gribble, Lazowska, Levy

15

The major OS issues

- **structure**: how is the OS organized?
- **sharing**: how are resources shared across users?
- **naming**: how are resources named (by users or programs)?
- **security**: how is the integrity of the OS and its resources ensured?
- **protection**: how is one user/program protected from another?
- **performance**: how do we make it all go fast?
- **reliability**: what happens if something goes wrong (either with hardware or with a program)?
- **extensibility**: can we add new features?
- **communication**: how do programs exchange information, including across a network?

1/15/2006

© 2006 Gribble, Lazowska, Levy

16

More OS issues...

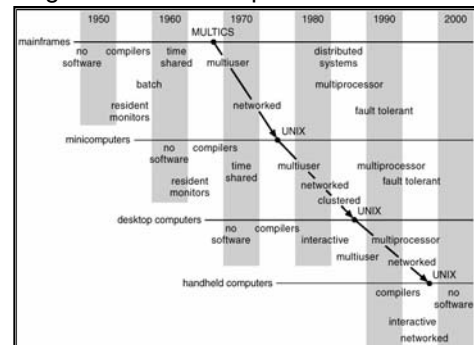

- **concurrency**: how are parallel activities (computation and I/O) created and controlled?
- **scale**: what happens as demands or resources increase?
- **persistence**: how do you make data last longer than program executions?
- **distribution**: how do multiple computers interact with each other?
- **accounting**: how do we keep track of resource usage, and perhaps charge for it?

17

Progression of concepts and form factors

1/15/2006

© Silberschatz, Galvin and Gagne

18

Multiple trends at work

- “Ontogeny recapitulates phylogeny”
 - Ernst Haeckel (1834-1919)
 - (“always quotable, even when wrong”)
- “Those who cannot remember the past are condemned to repeat it”
 - George Santayana (1863-1952)
- But new problems arise, and old problems re-define themselves
 - The evolution of PCs recapitulated the evolution of minicomputers, which had recapitulated the evolution of mainframes
 - But the ubiquity of PCs re-defined the issues in protection and security

1/15/2006

© 2006 Gribble, Lazowska, Levy

19

Protection and security as an example

- none
- OS from my program
- your program from my program
- my program from my program
- access by intruding individuals
- access by intruding programs
- denial of service
- distributed denial of service
- spoofing
- spam
- worms
- viruses
- stuff you download and run knowingly (bugs, trojan horses)
- stuff you download and run unknowingly (cookies, spyware)

1/15/2006

© 2006 Gribble, Lazowska, Levy

20

OS history

- In the very beginning...
 - OS was just a library of code that you linked into your program; programs were loaded in their entirety into memory, and executed
 - interfaces were literally switches and blinking lights
- And then came **batch systems**
 - OS was stored in a portion of primary memory
 - OS loaded the next job into memory from the card reader
 - job gets executed
 - output is printed, including a dump of memory
 - repeat...
 - card readers and line printers were very slow
 - so CPU was idle much of the time (wastes \$\$)

1/15/2006

© 2006 Gribble, Lazowska, Levy

21

Spooling

- Disks were much faster than card readers and printers
- Spool (**S**imultaneous **P**eripheral **O**perations **O**n-Line)
 - while one job is executing, spool next job from card reader onto disk
 - slow card reader I/O is overlapped with CPU
 - can even spool multiple programs onto disk
 - OS must choose which to run next
 - **job scheduling**
 - but, CPU still idle when a program interacts with a peripheral during execution
 - buffering, double-buffering

1/15/2006

© 2006 Gribble, Lazowska, Levy

22

Multiprogramming

- To increase system utilization, **multiprogramming** OSs were invented
 - keeps multiple runnable jobs loaded in memory at once
 - overlaps I/O of a job with computing of another
 - while one job waits for I/O completion, OS runs instructions from another job
 - to benefit, need **asynchronous** I/O devices
 - need some way to know when devices are done
 - interrupts
 - polling
 - goal: optimize system throughput
 - perhaps at the cost of response time...

1/15/2006

© 2006 Gribble, Lazowska, Levy

23

Timesharing

- To support interactive use, create a **timesharing OS**:
 - multiple terminals into one machine
 - each user has illusion of entire machine to him/herself
 - optimize response time, perhaps at the cost of throughput
- Timeslicing
 - divide CPU equally among the users
 - if job is truly interactive (e.g., editor), then can jump between programs and users faster than users can generate load
 - permits users to interactively view, edit, debug running programs (why does this matter?)

1/15/2006

© 2006 Gribble, Lazowska, Levy

24

- MIT CTSS system (operational 1961) was among the first timesharing systems
 - only one user memory-resident at a time
- MIT Multics system (operational 1968) was the first large timeshared system
 - nearly all OS concepts can be traced back to Multics!
 - "second system syndrome"

1/15/2006

© 2006 Gribble, Lazowska, Levy

25

- CTSS as an illustration of architectural and OS functionality requirements

1/15/2006

© 2006 Gribble, Lazowska, Levy

26

Distributed OS

- Distributed systems to facilitate use of geographically distributed resources
 - workstations on a LAN
 - servers across the Internet
- Supports communications between programs
 - interprocess communication
 - message passing, shared memory
 - networking stacks
- Sharing of distributed resources (hardware, software)
 - load balancing, authentication and access control, ...
- Speedup isn't the issue
 - access to diversity of resources is goal

1/15/2006

© 2006 Gribble, Lazowska, Levy

27

Parallel OS

- Some applications can be written as multiple parallel threads or processes
 - can speed up the execution by running multiple threads/processes simultaneously on multiple CPUs
 - need OS and language primitives for dividing program into multiple parallel activities
 - need OS primitives for fast communication between activities
 - degree of speedup dictated by communication/computation ratio
 - many flavors of parallel computers
 - SMPs (symmetric multi-processors)
 - MPPs (massively parallel processors)
 - NOWs (networks of workstations)
 - computational grid (SETI @home)

1/15/2006

© 2006 Gribble, Lazowska, Levy

28

Client/Server computing

- Mail server/service
- File server/service
- Print server/service
- Compute server/service
- Game server/service
- Music server/service
- Web server/service
- etc.

1/15/2006

© 2006 Gribble, Lazowska, Levy

29

Peer-to-Peer (p2p) systems

- Napster
- Gnutella
 - example technical challenge: self-organizing overlay network
 - technical advantage of Gnutella?
 - er ... legal advantage of Gnutella?

1/15/2006

© 2006 Gribble, Lazowska, Levy

30

Embedded/Mobile/Pervasive computing

- Pervasive computing
 - cheap processors embedded everywhere
 - how many are on your body now? in your car?
 - cell phones, PDAs, network computers, ...
- Typically very constrained hardware resources
 - slow processors
 - very small amount of memory (e.g., 8 MB)
 - no disk
 - typically only one dedicated application
 - limited power
- But this is changing rapidly!

1/15/2006

© 2006 Gribble, Lazowska, Levy

31

CSE 451

- In this class we will learn:
 - what are the major components of most OS's?
 - how are the components structured?
 - what are the most important (common?) interfaces?
 - what policies are typically used in an OS?
 - what algorithms are used to implement policies?
- Philosophy
 - you may not ever build an OS
 - but as a computer scientist or computer engineer you need to understand the foundations
 - most importantly, operating systems exemplify the sorts of engineering design tradeoffs that you'll need to make throughout your careers – compromises among and within cost, performance, functionality, complexity, schedule ...
