

CSE 451: Operating Systems Spring 2005

Module 20 Distributed Systems

Ed Lazowska
lazowska@cs.washington.edu
Allen Center 570

What is a “distributed system”?

- Very broad definition
 - loosely-coupled to tightly-coupled
- Nearly all systems today are distributed in some way
 - they use email
 - they access files over a network
 - they access printers over a network
 - they’re backed up over a network
 - they share other physical or logical resources
 - they use the web
 - they cooperate with other people on other machines

2

Distributed systems are now a requirement

- Economics dictate that we buy small computers
- Everyone needs to communicate
- We need to share physical devices (printers) as well as information (files, etc.)
- Many applications are by their nature distributed (bank teller machines, airline reservations, ticket purchasing)
- To solve the largest problems, we will need to get large collections of small machines to cooperate together (parallel programming)

3

Loosely-coupled systems

- Earliest systems used simple explicit network programs
 - FTP (rcp): file transfer program
 - telnet (rlogin/rsh): remote login program
 - mail (SMTP)
- Each system was a completely autonomous independent system, connected to others on the network

4

- Even today, most distributed systems are loosely-coupled
 - each CPU runs an independent autonomous OS
 - computers don’t really trust each other
 - some resources are shared, but most are not
 - the system may look differently from different hosts
 - typically, communication times are long

5

Closely-coupled systems

- A distributed system becomes more “closely-coupled” as it
 - appears more uniform in nature
 - runs a “single” operating system
 - has a single security domain
 - shares all logical resources (e.g., files)
 - shares all physical resources (CPUs, memory, disks, printers, etc.)
- In the limit, a distributed system looks to the user as if it were a centralized timesharing system, except that it’s constructed out of a distributed collection of hardware and software components

6

Tightly-coupled systems

- A “tightly-coupled” system usually refers to a multiprocessor
 - runs a single copy of the OS with a single job queue
 - has a single address space
 - usually has a single bus or backplane to which all processors and memories are connected
 - has very low communication latency
 - processors communicate through shared memory

7

Grapevine distributed mail service

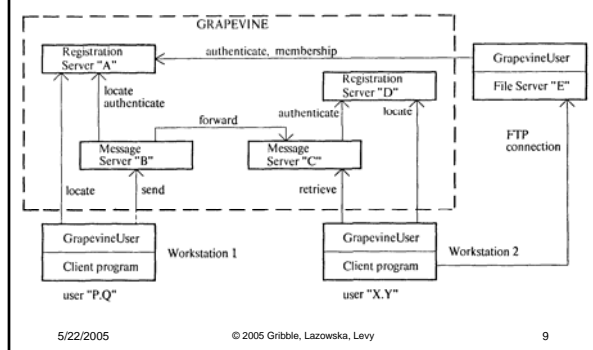

- Xerox PARC, 1980
 - cf. Microsoft Outlook/Exchange today!!!!
- Goals
 - cannot rely on integrity of client
 - once the system accepts mail, it will be delivered
 - no single Grapevine computer failure will make the system unavailable to any client either for sending or for receiving mail
- Components
 - GrapevineUser package on each client workstation
 - Registration Servers
 - Message Servers
- Implementation: Remote Procedure Call

9

Grapevine: Sending a message

- User prepares message using mail client
- Mail client contacts GrapevineUser package on same workstation to actually send message
- GrapevineUser package
 - contacts any Registration Server to get a list of Message Servers
 - presents source and destination userids, and source password, for authentication
 - Message Server uses any Registration Server to authenticate
 - sends message body to Message Server
 - Message Server places it in stable storage and acknowledges receipt

10

Grapevine: Transport and buffering

- For each recipient of the message, Message Server contacts any Registration Server to obtain list of Message Servers holding mail for that recipient
- Sends a copy of the message to one of those Message Servers for that recipient

11

Grapevine: Retrieving mail

- User uses mail client to contact GrapevineUser package on same workstation to retrieve mail
- GrapevineUser package
 - contacts any Registration Server to get a list of each Message Server holding mail for the user (“inbox site”)
 - contacts each of these Message Servers to retrieve mail
 - presents user credentials
 - Message Server uses any Registration Server to authenticate
 - acknowledges receipt of messages so that the server can delete them from its storage

12

Grapevine: Scalability

- Can add more Registration Servers
- Can add more Message Servers
- Only thing that didn't scale was handling of distribution lists
 - the accepting Message Server was responsible for expanding the list (recursively if necessary) and delivering to an appropriate Message Server for each recipient
 - some distribution lists contained essentially the entire user community
- Jeff Dean (Google) told us they don't even think about more than two decimal orders of magnitude
 - fundamental design decisions will need to change
 - advances in technology will make it possible

13

Some issues in distributed systems

- Transparency (how visible is the distribution)
- Security
- Reliability
- Performance
- Scalability
- Programming models
- Communication models
