Directories

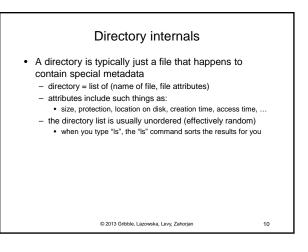

• Directories provide:

- a way for users to organize their files
- a convenient file name space for both users and FS's • Most file systems support multi-level directories
- naming hierarchies (/, /usr, /usr/local, /usr/local/bin, ...) · Most file systems support the notion of current
- directory
 - absolute names: fully-qualified starting from root of FS bash\$ cd /usr/local
 - relative names: specified with respect to current directory bash\$ cd /usr/local (absolute) bash\$ cd bin (relative, end (relative, equivalent to cd /usr/local/bin)

Path name translation

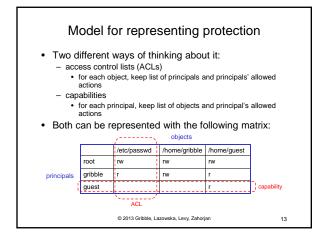

- Let's say you want to open "/one/two/three" fd = open("/one/two/three", O_RDWR);
- · What goes on inside the file system?
 - open directory "/" (well known, can always find)
 - search the directory for "one", get location of "one"
 - open directory "one", search for "two", get location of "two"
 - open directory "two", search for "three", get loc. of "three"
 - open file "three"
 - (of course, permissions are checked at each step)
- · FS spends lots of time walking down directory paths
 - this is why open is separate from read/write (session state)
 - OS will cache prefix lookups to enhance performance

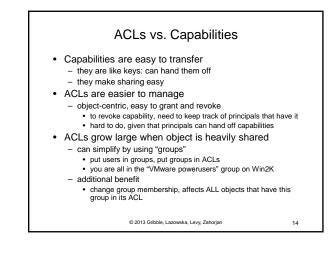

· /a/b, /a/bb, /a/bbb all share the "/a" prefix

The "block list" portion of the i-node (Unix Version 7)
Points to blocks in the file contents area
Must be able to represent very small and very large files. How?
Each inode contains 13 block pointers
first 10 are "direct pointers" (pointers to 512B blocks of file data)
then, single, double, and triple indirect pointers

fsck i-check (consistency of the flat file system)

- Is each block on exactly one list?
 - create a bit vector with as many entries as there are blocks
 - follow the free list and each i-node block list
 - when a block is encountered, examine its bit
 - If the bit was 0, set it to 1
 - · if the bit was already 1
 - if the block is both in a file and on the free list, remove it from the free list and cross your fingers
 - if the block is in two files, call support!
 - if there are any 0's left at the end, put those blocks on the free list
