Animation Principles

CSE 457, Autumn 2003
Graphics

Readings and References

• Readings
  » Tricks to animating characters with a computer, Siggraph 94, Course 1, Animation Tricks. John Lasseter.

• Reference

It's all (simulated) smoke and mirrors

“Traditional animation is basically one trick after another. Whatever it takes to get it working right on the screen is fair game. It should be the same in computer animation.”

John Lasseter

Animation Objectives

• Expressiveness
  » Artistic expression
  » Extremely hard to automate

• Realism
  » Hard to do by hand
  » Easier to automate, but we lose control
Character Animation

- Make characters move in convincing way to communicate personality and mood
  » Walt Disney developed a number of principles
  » Computer graphics animators have adapted them to 3D animation

Animation principles

- Squash and stretch
- Staging
- Timing
- Anticipation
- Follow through
- Overlapping action
- Secondary action
- Arcs
- Straight-ahead vs. pose-to-pose vs. blocking
- Slow in, slow out
- Exaggeration
- Appeal
- Weight

Squash and stretch

**Squash**: flatten an object or character by pressure or by its own power

**Stretch**: used to increase the sense of speed and emphasize the squash by contrast

Note: keep volume constant
Squash and stretch (cont’d)

Staging

- Present the idea so it is unmistakably clear
- Audience can only see one thing at a time
- Useful guide: stage actions in silhouette
- In dialogue, character faces ¾ towards the camera, not right at each other
Timing

Timing affects weight:
- Light objects move quickly
- Heavier objects move more slowly
- Timing can completely change the meaning of an action

Timing examples

Anticipation

An action has three parts:
- Anticipation
- Action
- Reaction

Anatomical motivation: a muscle must extend before it can contract
- Prepares audience for action so they know what to expect
- Directs audience’s attention
- Amount of anticipation can affect perception of speed and weight
Anticipation

Follow through

- Action seldom come to an abrupt stop
- Physical motivation: inertia

Follow through

Overlapping and secondary action

Overlapping Action
One part initiates (leads) the move. Others follow in turn.
  » Hip leads legs, but eyes often lead the head.
  » Loose parts move slower and drag behind.

Overlaps apply to intentions. Example: settling into the house at night
  » Close the door
  » Lock the door
  » Take off the coat

Each action doesn’t come to a complete finish before the next starts

Secondary action
An action that emphasizes the main point, but is secondary to it.
Overlapping and secondary action

Avoid straight lines since most things in nature move along curves

Action planning

- Straight ahead: proceed from frame to frame without planning where you want to be in ten frames. Can be wild, spontaneous.
- Pose-to-pose: Define key frames and “inbetweens”.
- Blocking: computer graphics animators adaptation:
  » Start key–framing at the top of the hierarchy
  » Refine level by level
  » Key frames for different parts need not happen at the same time.

The plan
The result

Slow in, slow out

• An extreme pose can be emphasized by slowing down as you get to it (and as you leave it)

Slow in, slow out examples

Exaggeration

Get to the heart of the idea and emphasize it so the audience can see it.
**Appeal**

The character must interest the viewer. It doesn’t have to be cute and cuddly. Design, simplicity, behavior all affect appeal. Note: avoid perfect symmetries.

**Design, simplicity, behavior all affect appeal.**

Example: Luxo, Jr. is made to appear childlike.

**Weight**

**Frontiers: faces**

- Making realistic human facial animations is really hard
- Modeling the shape of a face
  - free form CAD design
  - photographs, laser scanner (0.5mm resolution)
- Designing the right set of controls
  - Muscle groups
  - Blending example expressions
  - spline control points
- Future input device: performance driven facial animation
  - animator makes faces
  - video camera watches
  - computer processes in real time
  - character’s face comes to life
  - animators are actors!!
Geometric modeling and instrumentation

Building characters with the right shape and control points is time consuming..

Want the “right” set of controls
  » Control points
  » Muscle groups
  » Blending example expressions
  » “Instrumentation” controls

Physical simulation

Some effects are too difficult to model by hand (fire, snow, steam, rustling trees, hair, cloth, etc.)

Can do simulation (both physical and non-physical)
  » Particle systems
  » Fluid flow and turbulence modeling
  » Rigid body dynamics
  » …

Physical simulation (cont’d)

As illustrated

Frontiers: controllable simulation

• The main problem: animator and director want to have some interactive control.

• Example: I want this object to land here …
  » How do you merge this with the physical simulation?
Controllable simulation

Frontiers: motion capture

- Making a realistic human body motion is hard
- Approaches
  - Computer vision using raw video footage
    - not accurate enough
  - Special sensors that give joint angles and/or positions
    - wires get in the way
- Cover person with white or retroreflective targets like ping pong balls
  - Have to handle occlusions
