#### Problem solving and search

Chapter 3, Sections 1-5

AIMA Slides @Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5

#### Outline

- ♦ Problem-solving agents
- ♦ Problem types
- ♦ Problem formulation
- ♦ Example problems
- ♦ Basic search algorithms

AIMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 2

### Problem-solving agents

#### Restricted form of general agent:

Note: this is offline problem solving.

 ${\it Online}$  problem solving involves acting without complete knowledge of the problem and solution.

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 3

### Example: Romania

On holiday in Romania; currently in Arad Flight leaves tomorrow from Bucharest

#### Formulate goal:

be in Bucharest

#### Formulate problem:

states: various cities operators: drive between cities

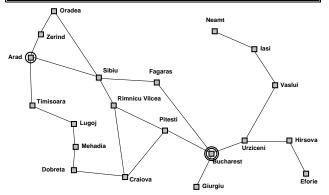

#### Find solution:

sequence of cities, e.g., Arad, Sibiu, Fagaras, Bucharest

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 4

#### Example: Romania

### Problem types

 $\begin{array}{ll} \underline{\text{Deterministic, accessible}} \Longrightarrow \mathit{single\text{-}state\ problem} \\ \underline{\text{Deterministic, inaccessible}} \Longrightarrow \mathit{multiple\text{-}state\ problem} \end{array}$ 

Nondeterministic, inaccessible ⇒ contingency problem must use sensors during execution solution is a tree or policy often interleave search, execution

Unknown state space  $\implies exploration \ problem$  ("online")

AIMA Slider @Suant Runell and Peter Norvig, 1998 Chapter 3, Sections 1-5 5 AIMA Slider @Suant Runell and Peter Norvig, 1998 Chapter 3, Sections 1-5 6

### Example: vacuum world

Single-state, start in #5. Solution??

Multiple-state, start in {1, 2, 3, 4, 5, 6, 7, 8}

e.g., Right goes to {2, 4, 6, 8}. Solution??

Contingency, start in #5

Murphy's Law: Suck can dirty a clean carpet
Local sensing: dirt, location only.

Solution??

AIMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 7

#### Single-state problem formulation

A problem is defined by four items:

initial state e.g., "at Arad"

 $\underline{operators}$  (or  $successor\ function\ S(x)$ )

 $\overline{\text{e.g.}}$  Arad  $\rightarrow$  Zerind Arad  $\rightarrow$  Sibiu etc.

goal test, can be

explicit, e.g., x = "at Bucharest" implicit, e.g., NoDirt(x)

 $\underline{path} \ cost$  (additive)

e.g., sum of distances, number of operators executed, etc.

A *solution* is a sequence of operators leading from the initial state to a goal state

AIMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 8

#### Selecting a state space

Real world is absurdly complex

 $\Rightarrow$  state space must be abstracted for problem solving

(Abstract) state = set of real states

(Abstract) operator = complex combination of real actions e.g., "Arad  $\rightarrow$  Zerind" represents a complex set

of possible routes, detours, rest stops, etc.

For guaranteed realizability, any real state "in Arad" must get to some real state "in Zerind"

(Abstract) solution =

set of real paths that are solutions in the real world

Each abstract action should be "easier" than the original problem!

Chapter 3, Sections 1-5 9

# Example: The 8-puzzle

5 4	1 2 3
6 1 8	8 4
7 3 2	7 6 5
Start State	Goal State

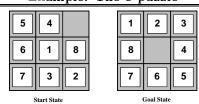

states??
operators??
goal test??
path cost??

AIMA Slides © Stuart Russell and Peter Norvig, 1998

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 10

#### Example: The 8-puzzle

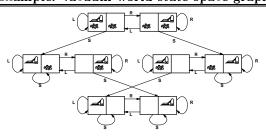

<u>states??</u>: integer locations of tiles (ignore intermediate positions)
<u>operators?</u>?: move blank left, right, up, down (ignore unjamming etc.)
<u>goal test?</u>?: = goal state (given)

path cost??: 1 per move

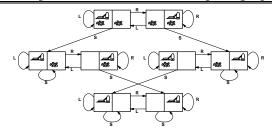

[Note: optimal solution of  $n ext{-}\text{Puzzle family is NP-hard}]$ 

#### Example: vacuum world state space graph

states??
operators??
goal test??
path cost??

### Example: vacuum world state space graph

states??: integer dirt and robot locations (ignore dirt amounts)

operators??: Left, Right, Suck

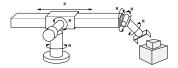

goal test??: no dirt

path cost??: 1 per operator

AIMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 13

### Example: robotic assembly

states??: real-valued coordinates of robot joint angles parts of the object to be assembled

operators??: continuous motions of robot joints

 $\underline{\texttt{goal test}}??: \ \mathsf{complete} \ \mathsf{assembly} \ \mathit{with} \ \mathit{no} \ \mathit{robot} \ \mathit{included!}$ 

path cost??: time to execute

AlMA Slides @Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 14

### Search algorithms

#### Basic idea:

offline, simulated exploration of state space by generating successors of already-explored states (a k a expanding states)

function General-Search(problem, strategy) returns a solution, or failure initialize the search tree using the initial state of problem

loop do
if there are no candidates for expansion then return failure choose a leaf node for expansion according to  $\mathit{strategy}$  if the node contains a goal state  $\mathit{then}$   $\mathit{return}$  the corresponding solution  $\mathit{else}$  expand the node and add the resulting nodes to the search tree

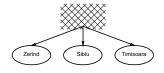

General search example

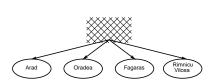

AIMA Slides @Stuart Russell and Peter Norvig, 1998

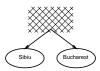

Chapter 3, Sections 1-5 15

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 16

#### Implementation of search algorithms

function General-Search (problem, Queuing-Fn) returns a solution, or failure  $nodes \leftarrow \texttt{Make-Queue}(\texttt{Make-Node}(\texttt{Initial-State}[\textit{problem}]))$ loop do if nodes is empty then return failure

 $node \leftarrow Remove-Front(nodes)$ 

if Goal-Test[problem] applied to State(node) succeeds then return node  $nodes \leftarrow \texttt{Queuing-Fn} \big(nodes, \texttt{Expand} \big(node, \texttt{Operators}[problem]\big)\big)$ 

AIMA Slides @Stuart Russell and Peter Norvig, 1998

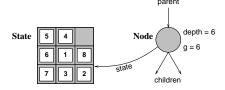

Chapter 3, Sections 1-5 19

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 20

#### Implementation contd: states vs. nodes

A state is a (representation of) a physical configuration A node is a data structure constituting part of a search tree includes parent, children, depth, path cost g(x)States do not have parents, children, depth, or path cost!

The  $\operatorname{Expand}$  function creates new nodes, filling in the various fields and using the OPERATORS (or SUCCESSORFN) of the problem to create the corresponding states.

AIMA Slides @Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 21

#### Search strategies

A strategy is defined by picking the order of node expansion

Strategies are evaluated along the following dimensions: completeness—does it always find a solution if one exists? time complexity—number of nodes generated/expanded space complexity—maximum number of nodes in memory optimality—does it always find a least-cost solution?

Time and space complexity are measured in terms of b—maximum branching factor of the search tree d—depth of the least-cost solution m—maximum depth of the state space (may be  $\infty$ )

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 22

#### Uninformed search strategies

Uninformed strategies use only the information available in the problem definition

Breadth-first search

Uniform-cost search

Depth-first search

Depth-limited search

Iterative deepening search

#### Breadth-first search

Expand shallowest unexpanded node

Implementation:

 $\overline{\mathrm{QUEUEINGFN}} = \mathsf{put}$  successors at end of queue

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 25

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 26

### Properties of breadth-first search

Complete??

<u>Time</u>??

Space??

 $\underline{\mathsf{Optimal}} ??$ 

AlMA Slides @ Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 27

AlMA Slides @Stuart Russell and Peter Norvig, 1998

Chapter 3, Sections 1-5 28

### Properties of breadth-first search

Complete?? Yes (if b is finite)

 $\underline{\mathsf{Time}} ? ? \ 1 + b + b^2 + b^3 + \ldots + b^d = O(b^d), \text{ i.e., exponential in } d$ 

Space??  $O(b^d)$  (keeps every node in memory)

 $\underline{\mathsf{Optimal}} \ensuremath{??} \ensuremath{\,\,} \mathsf{Yes} \ (\mathsf{if} \ \mathsf{cost} = 1 \ \mathsf{per} \ \mathsf{step}); \ \mathsf{not} \ \mathsf{optimal} \ \mathsf{in} \ \mathsf{general}$ 

 $\mathit{Space}$  is the big problem; can easily generate nodes at 1MB/sec so 24hrs = 86GB.

# Romania with step costs in km

### Uniform-cost search

Expand least-cost unexpanded node

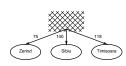

Implementation

 $\overline{\mathrm{QUEUEINGFN}}=$  insert in order of increasing path cost
