We are Language Designers!

What have we done?
- Define a programming language
  - we were fairly formal
  - still pretty close to OCaml if you squint real hard
- Define a type system
  - outlaw bad programs that “get stuck”
  - sound: no typable programs get stuck
  - incomplete: knocked out some OK programs too, ohwell

Elsewhere in the Universe (or the other side of campus)

What do logicians do?
- Define formal logics
  - tools to precisely state propositions
- Define proof systems
  - tools to figure out which propositions are true

Turns out, we did that too!

Punchline

We are accidental logicians!

The Curry-Howard Isomorphism
- Proofs : Propositions :: Programs : Types
- proofs are to propositions as programs are to types
Woah. Back up a second. Logic?!

Let’s trim down our (explicitly typed) simply-typed λ-calculus to:

\[
e ::= x | \lambda x. e | ee
| (e,e) | e.1 | e.2
| A(e) | B(e) | \text{match } e \text{ with } Ax. e | Bx. e
\]

\[
\tau ::= b | \tau \to \tau | \tau \star \tau | \tau + \tau
\]

▶ Lambdas, Pairs, and Sums
▶ Any number of base types \(b_1, b_2,\ldots\)
▶ No constants (can add one or more if you want)
▶ No fix

What good is this?!

Well, even sans constants, plenty of terms type-check with \(\Gamma = \cdot\)

\[
\lambda x:b. x
\]

\[
\lambda x:b_1. \lambda f:b_1 \to b_2. f x
\]

has type

\[
\lambda x:b_1 \to b_2 \to b_3. \lambda y:b_2. \lambda z:b_1. x z y
\]

\[
b_1 \to (b_1 \to b_2) \to b_2
\]

\[
(b_1 \to b_2 \to b_3) \to b_2 \to b_1 \to b_3
\]
\[
\lambda x : b_1. (A(x), A(x))
\]
has type
\[
b_1 \rightarrow ((b_1 + b_7) \ast (b_1 + b_4))
\]

\[
\lambda f : b_1 \rightarrow b_3. \lambda g : b_2 \rightarrow b_3. \lambda z : b_1 + b_2.
\]
\[
\text{(match } z \text{ with } Ax. f x | Bx. g x)
\]
has type
\[
(b_1 \rightarrow b_3) \rightarrow (b_2 \rightarrow b_3) \rightarrow (b_1 + b_2) \rightarrow b_3
\]
Propositional Logic

Suppose we have some set \( b \) of basic propositions \( b_1, b_2, \ldots \)

- e.g. “ML is better than Haskell"

Then, using standard operators \( \supset, \land, \lor \), we can define formulas:

\[
p ::= b \mid p \supset p \mid p \land p \mid p \lor p
\]

- e.g. “ML is better than Haskell” \( \land \) “Haskell is not pure”

Some formulas are tautologies: by virtue of their structure, they are always true regardless of the truth of their constituent propositions.

- e.g. \( p_1 \supset p_1 \)

Not too hard to build a proof system to establish tautologyhood.

Proof System

\[
\Gamma ::= \cdot \mid \Gamma, p
\]

\[
\begin{align*}
\Gamma \vdash p \\
\Gamma \vdash p_1 \\
\Gamma \vdash p_2 \\
\Gamma \vdash p_1 \land p_2 \\
\Gamma \vdash p_2 \\
\Gamma \vdash p_1 \\
\Gamma \vdash p_1 \lor p_2 \\
\Gamma \vdash p_2 \\
\Gamma \vdash p_1 \lor p_2 \\
\Gamma, p_1 \vdash p_3 \\
\Gamma, p_2 \vdash p_3 \\
\Gamma \vdash p_3 \\
p \in \Gamma \\
\Gamma \vdash p \\
\Gamma \vdash p \supset p_2 \\
\Gamma, p_1 \vdash p_2 \\
\Gamma \vdash p \supset p_2 \\
\Gamma \vdash p_1 \\
\Gamma \vdash p_1 \lor p_2 \\
\Gamma \vdash p_2 \\
\end{align*}
\]
Wait a second... ZOMG!

That’s exactly our type system! Just erase terms, change each $\tau$ to a $p$, and translate $\to$ to $\supset$, $\ast$ to $\land$, and $\tau_1 + \tau_2$ to $\vee$.

\[
\begin{align*}
\Gamma \vdash e : \tau \\
\Gamma \vdash e_1 : \tau_1 & \quad \Gamma \vdash e_2 : \tau_2 \\
\Gamma \vdash (e_1, e_2) : \tau_1 \cdot \tau_2 \\
\Gamma \vdash e.1 : \tau & \quad \Gamma \vdash e.2 : \tau_2 \\
\end{align*}
\]

\[
\begin{align*}
\Gamma \vdash e : \tau_1 & \quad \Gamma \vdash e : \tau_2 \\
\Gamma \vdash A(e) : \tau_1 + \tau_2 & \quad \Gamma \vdash B(e) : \tau_1 + \tau_2 \\
\Gamma \vdash e_1 : \tau_1 & \quad \Gamma \vdash e_1 : \tau & \quad \Gamma \vdash y : \tau_2 & \quad \Gamma \vdash e_2 : \tau \\
\Gamma \vdash \text{match } e \text{ with } Ax. e_1 \mid By. e_2 : \tau \\
\end{align*}
\]

\[
\begin{align*}
\Gamma(x) = \tau & \quad \Gamma, x : \tau_1 \vdash e : \tau_2 \\
\Gamma \vdash \lambda x. e : \tau_1 \to \tau_2 & \quad \Gamma \vdash e_1 : \tau_2 \to \tau_1 & \quad \Gamma \vdash e_2 : \tau_2 \\
\Gamma \vdash e_1 e_2 : \tau_1 \\
\end{align*}
\]

What does it all mean? The Curry-Howard Isomorphism.

- Given a well-typed closed term, take the typing derivation, erase the terms, and have a propositional-logic proof.
- Given a propositional-logic proof, there exists a closed term with that type.
- A term that type-checks is a proof — it tells you exactly how to derive the logical formula corresponding to its type.
- Constructive (hold that thought) propositional logic and simply-typed lambda-calculus with pairs and sums are the same thing.
  - Computation and logic are deeply connected.
  - $\lambda$ is no more or less made up than implication.
- Revisit our examples under the logical interpretation...

\[
\begin{align*}
\lambda x : b. \ x \\
is a \ proof \ that \\
\ b \to b
\end{align*}
\]

\[
\begin{align*}
\lambda x : b_1. \ \lambda f : b_1 \to b_2. \ f \ x \\
is a \ proof \ that \\
\ b_1 \to (b_1 \to b_2) \to b_2
\end{align*}
\]
\[ \lambda x : b_1 \to b_2 \to b_3. \lambda y : b_2. \lambda z : b_1. \ x \ z \ y \]

is a proof that

\[ (b_1 \to b_2 \to b_3) \to b_2 \to b_1 \to b_3 \]

is a proof that

\[ b_1 \to ((b_1 + b_7) \ast (b_1 + b_4)) \]

\[ \lambda f : b_1 \to b_3. \lambda g : b_2 \to b_3. \lambda z : b_1 + b_2. \ (\text{match } z \text{ with } A \ x. \ f \ x | B \ x. \ g \ x) \]

is a proof that

\[ (b_1 \to b_3) \to (b_2 \to b_3) \to (b_1 + b_2) \to b_3 \]

is a proof that

\[ (b_1 \ast b_2) \to b_3 \to ((b_3 \ast b_1) \ast b_2) \]
So what?

Because:

▶ This is just fascinating (glad I’m not a dog)
▶ Don’t think of logic and computing as distinct fields
▶ Thinking “the other way” can help you know what’s possible/impossible
▶ Can form the basis for theorem provers
▶ Type systems should not be ad hoc piles of rules!

So, every typed $\lambda$-calculus is a proof system for some logic...

Is STLC with pairs and sums a complete proof system for propositional logic? Almost...

Classical vs. Constructive

Classical propositional logic has the “law of the excluded middle”:

$$\Gamma \vdash p_1 + (p_1 \to p_2)$$

(Think “$p + \neg p$” – also equivalent to double-negation $\neg\neg p \to p$)

STLC does not support this law; for example, no closed expression has type $b_1 + (b_1 \to b_2)$

Logics without this rule are called constructive. They’re useful because proofs “know how the world is” and “are executable” and “produce examples”

Can still “branch on possibilities” by making the excluded middle an explicit assumption:

$$((p_1 + (p_1 \to p_2)) \ast (p_1 \to p_3) \ast ((p_1 \to p_2) \to p_3)) \to p_3$$

Classical vs. Constructive, an Example

Theorem: There exist irrational numbers $a$ and $b$ such that $a^b$ is rational.

Classical Proof:

Let $x = \sqrt{2}$. Either $x^x$ is rational or it is irrational.

If $x^x$ is rational, let $a = b = \sqrt{2}$, done.

If $x^x$ is irrational, let $a = x^x$ and $b = x$. Since

$$\left(\sqrt{2}^{\sqrt{2}}\right)^{\sqrt{2}} = \sqrt{2}^{(\sqrt{2}\cdot\sqrt{2})} = \sqrt{2}^2 = 2, \text{ done.}$$

Well, I guess we know there are some $a$ and $b$ satisfying the theorem... but which ones? LAME.

Constructive Proof:

Let $a = \sqrt{2}$, $b = \log_2 9$.

Since $\sqrt{2}^{\log_2 9} = 9^{\log_2 \sqrt{2}} = 9^{\log_2 (2^{0.5})} = 9^{0.5} = 3, \text{ done.}$

To prove that something exists, we actually had to produce it. SWEET.

Classical vs. Constructive, a Perspective

Constructive logic allows us to distinguish between things that classical logic lumps together.

Consider “$P$ is true.” vs. “It would be absurd if $P$ were false.”

▶ $P$ vs. $\neg\neg P$

Those are different things, but classical logic can’t tell.

Our friends Gödel and Gentzen gave us this nice result:

$P$ is provable in classical logic iff $\neg\neg P$ is provable in constructive logic.
Fix

A “non-terminating proof” is no proof at all.

Remember the typing rule for `fix`:

\[
\Gamma \vdash e : \tau \rightarrow \tau \\
\Gamma \vdash \text{fix } e : \tau
\]

That let’s us prove anything! Example: `fix \lambda x : b. x` has type `b`

So the “logic” is inconsistent (and therefore worthless)

Related: In ML, a value of type `'a` never terminates normally (raises an exception, infinite loop, etc.)

```ml
let rec f x = f x
let z = f 0
```

Last word on Curry-Howard

It’s not just STLC and constructive propositional logic

Every logic has a corresponding typed $\lambda$ calculus (and no consistent logic has something as “powerful” as `fix`).

If you remember one thing: the typing rule for function application is `modus ponens`
