CSE 512 - Data Visualization

Animation

Jeffrey Heer University of Washington

Why Use Motion?

Visual variable to encode data

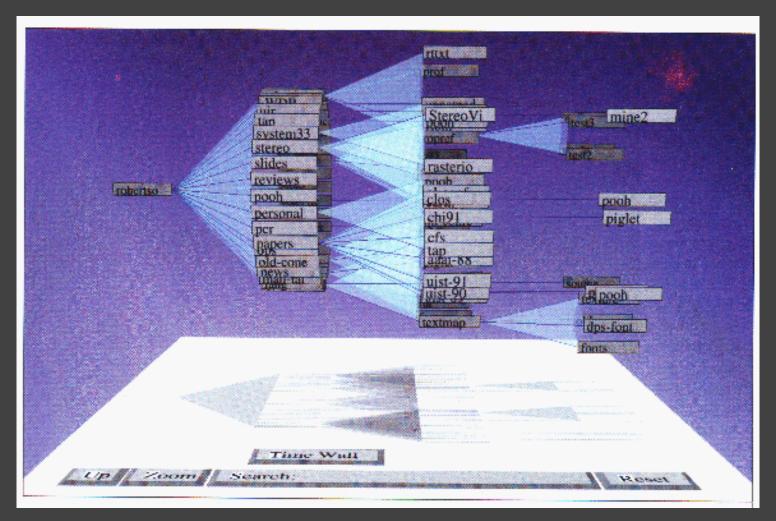

Direct attention

Understand system dynamics

Understand state transition

Increase engagement

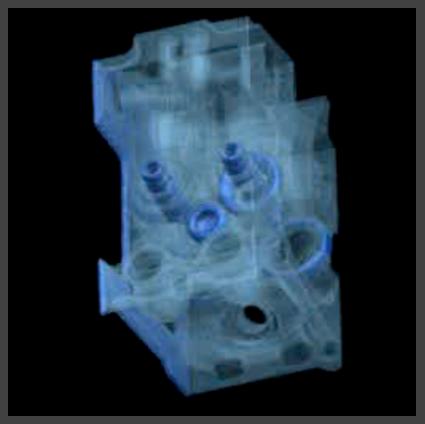

Cone Trees [Robertson 91]

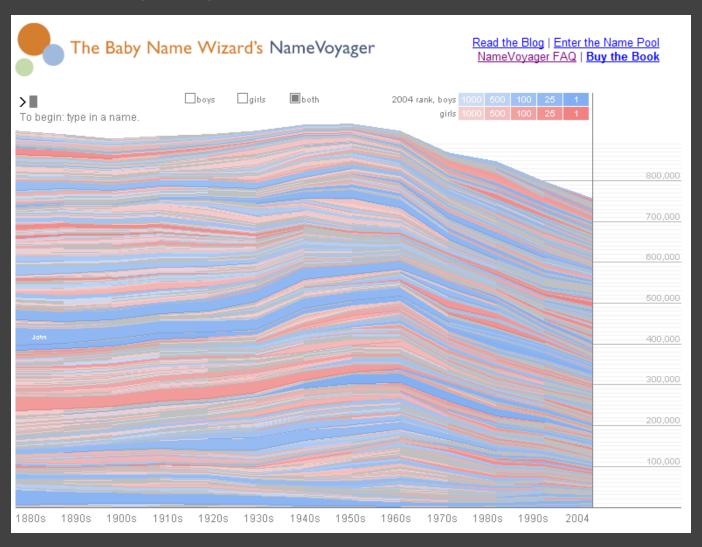

Volume Rendering [Lacroute 95]

NameVoyager [Wattenberg 04]

Topics

Motion perception

Principles for animation

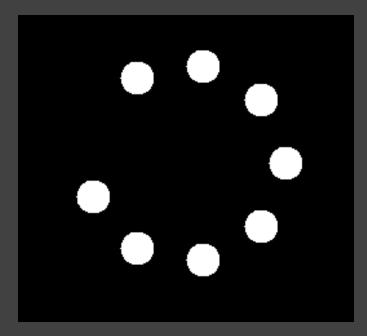

Animated transitions in visualizations

Motion Perception

Perceiving Animation

Under what conditions does a sequence of static images give rise to motion perception?

Smooth motion perceived at ~10 frames/sec (100 ms).

http://www1.psych.purdue.edu/Magniphi/PhilsNotBeta/phi2.html

Motion as Visual Cue

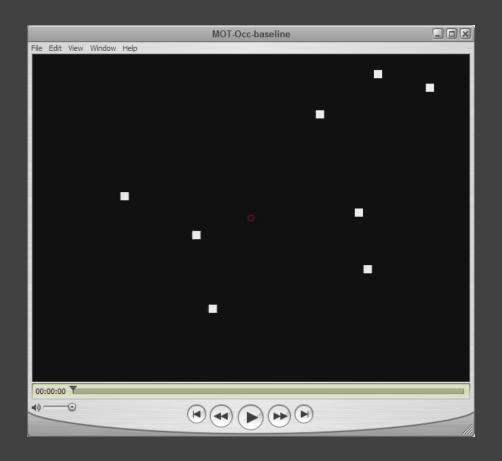

Pre-attentive, stronger than color, shape, ...

More sensitive to motion at periphery

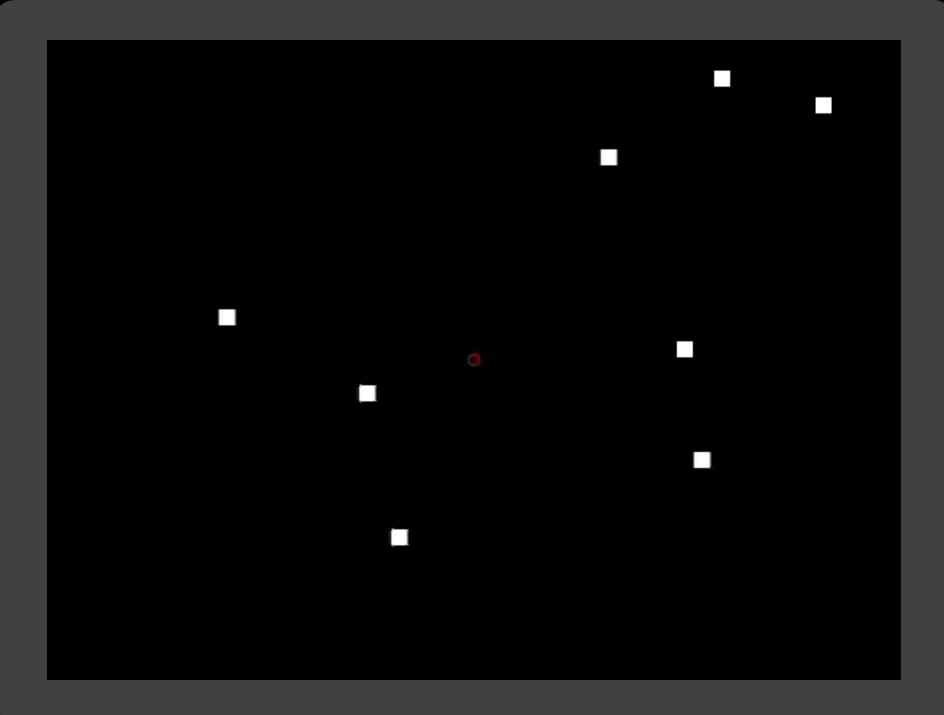

Similar motions perceived as a group

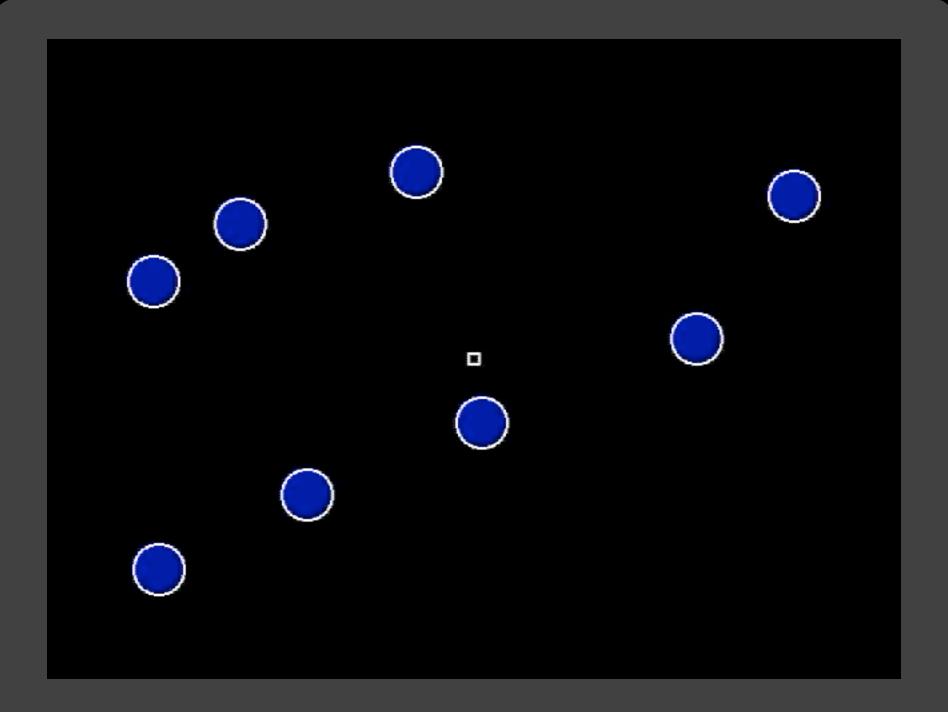

Motion parallax provide 3D cue (like stereopsis)

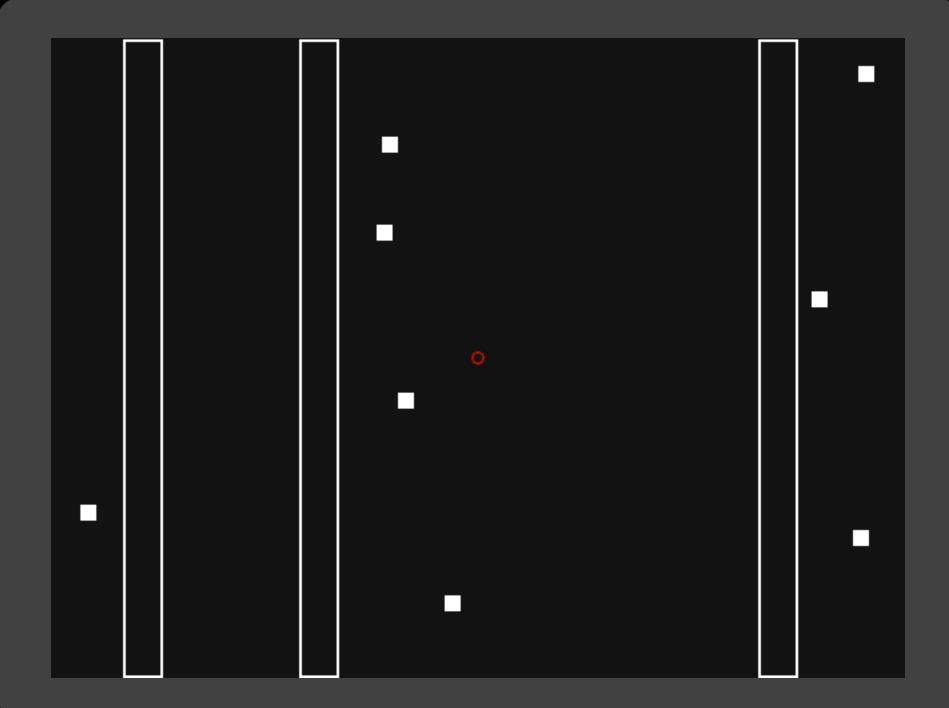

Tracking Multiple Targets

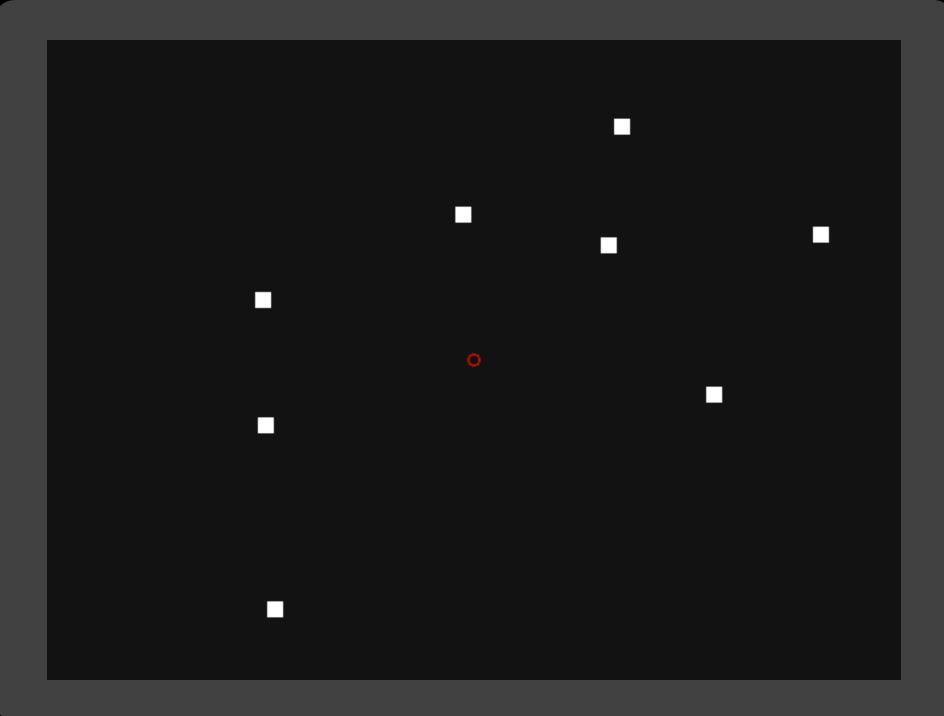

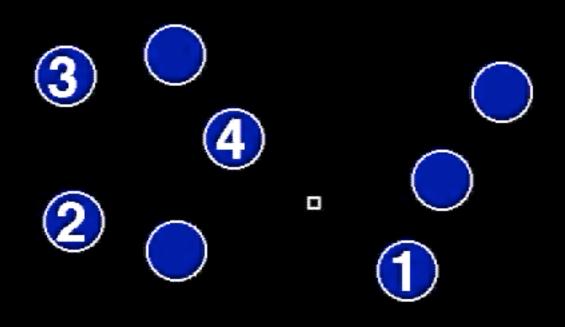

How many dots can we simultaneously track?

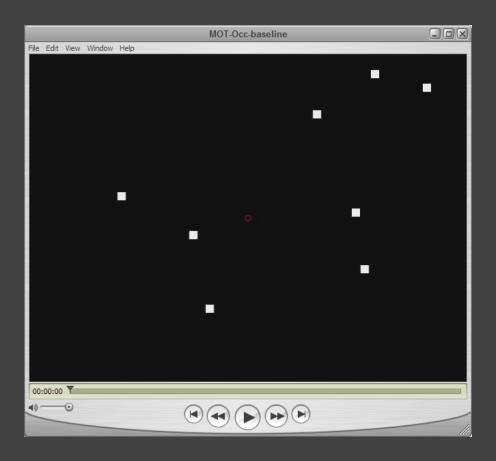

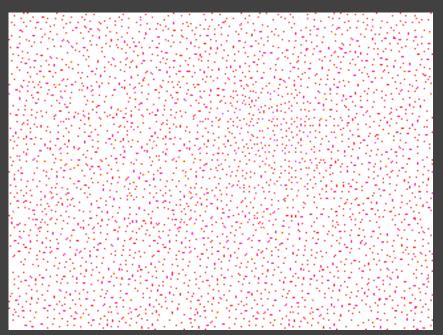

Tracking Multiple Targets

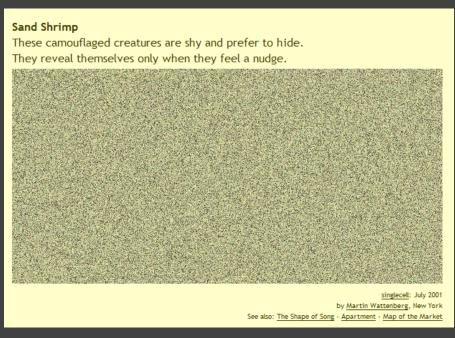

How many dots can we simultaneously track?

~4-6. Difficulty increases sig. at 6. [Yantis 92, Pylyshn 88, Cavanagh 05]

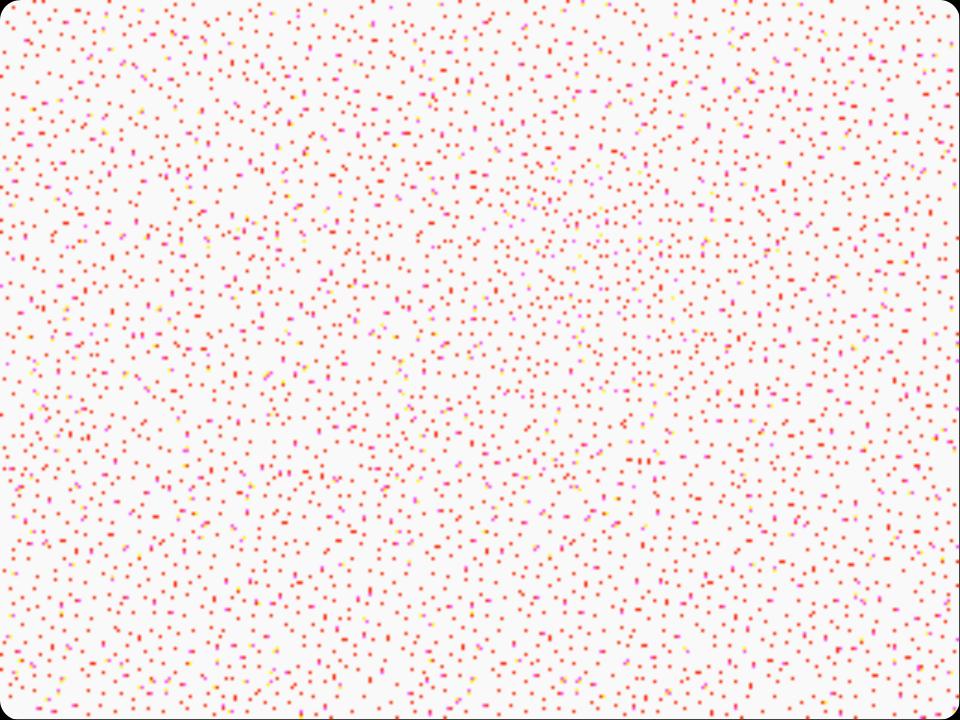

Segment by Common Fate

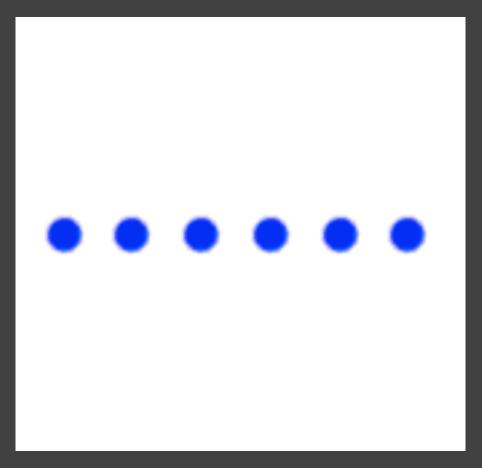

http://dragon.uml.edu/psych/commfate.html

http://www.singlecell.org/july/index.html

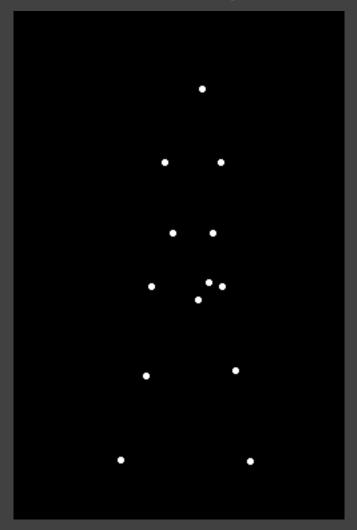

Grouped Dots Count as 1 Object

Dots moving together are grouped

http://coe.sdsu.edu/eet/articles/visualperc1/start.htm

Grouping of Biological Motion

[Johansson 73]

Motions Show Transitions

See change from one state to next

start

Motions Show Transitions

See change from one state to next

end

Motions Show Transitions

See change from one state to next

start

end

Shows transition better, but

Still may be too fast, or too slow

Too many objects may move at once

Velocity Perception

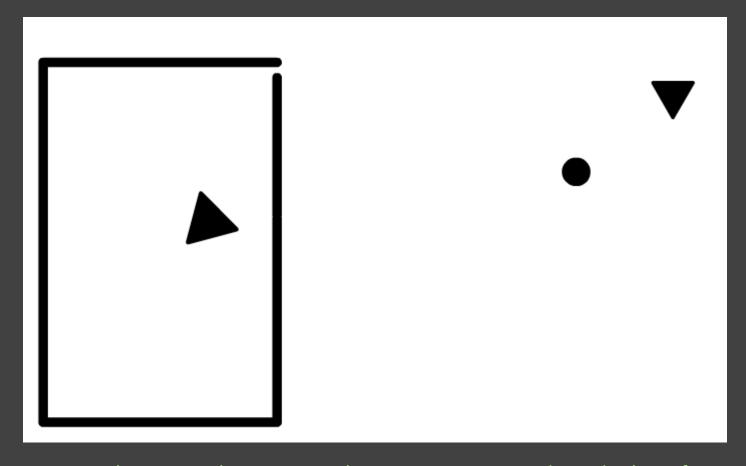

What is perceived as smooth, uniform motion?

Velocity perception can be affected by:

- Path curvature
- Size / depth perception
- Luminance contrast

(DEMO)

Constructing Narratives

http://anthropomorphism.org/img/Heider_Flash.swf

Attribution of Causality [Michotte 46]

Michotte demonstration 1. What do you see? Most observers report that "the red ball hit the blue ball." The blue ball moved "because the red ball hit it." Thus, the red ball is perceived to "cause" the blue ball to move, even though the balls are nothing more than color disks on your screen that move according to a programme.

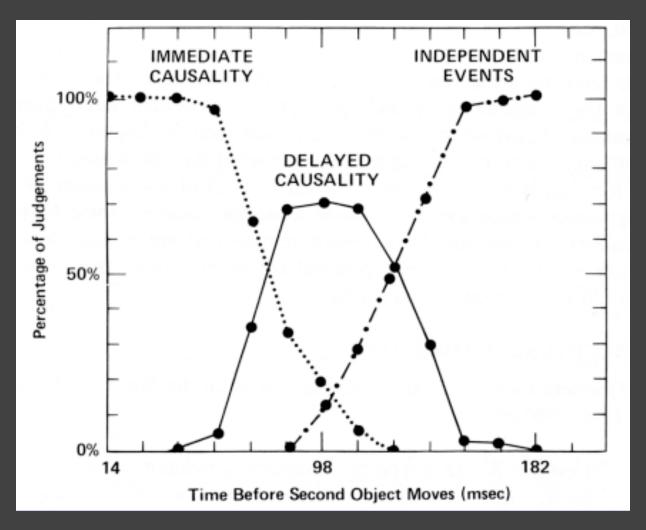

http://cogweb.ucla.edu/Discourse/Narrative/michotte-demo.swf

Attribution of Causality [Michotte 46]

[Reprint from Ware 04]

Animation Helps?

Attention

Constancy

Causality

Engagement

Calibration

direct attention

change tracking false relations

cause and effect false agency

increase interest "chart junk"

Hurts?

distraction

too slow: boring

too fast: errors

Animation Principles

Principles for Animation

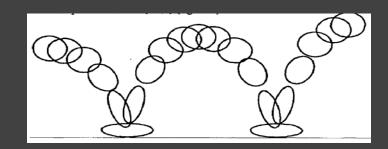

Character Animation

(Johnston & Thomas '81, Lasseter '87)

Squash and stretch

Exaggeration

Anticipation, Follow-through Staging, Overlapping Action Slow-in / Slow-out

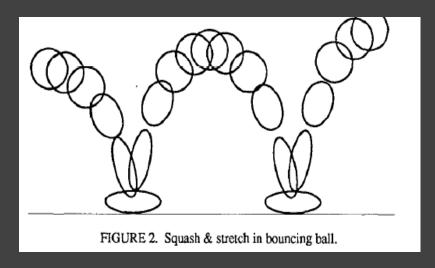

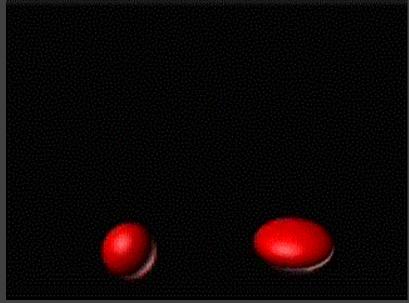

Squash & Stretch

Defines rigidity of material

Should maintain constant volume

Smoothes fast motion, similar to motion blur

Staging

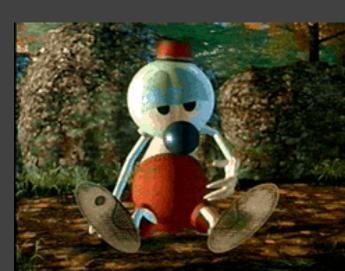

Clear presentation of one idea at a time

Highlight important actions

Lead viewers' eyes to the action

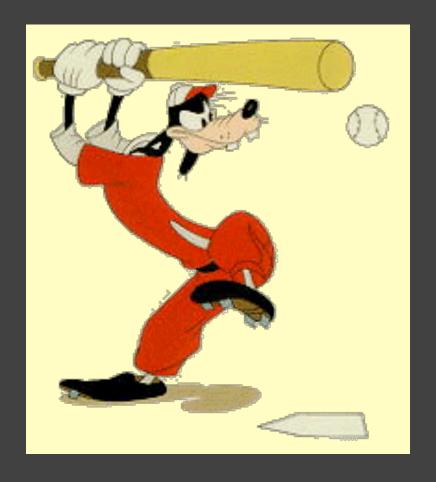

Motion in still scene, stillness in busy scene

Motion clearest at silhouette

Anticipation

Show preparation for an action

Follow-Through

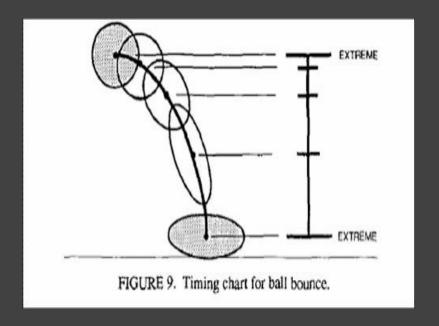

Emphasize termination of action

Slow-In, Slow-Out

Space in-betweens to provide slow-in and out

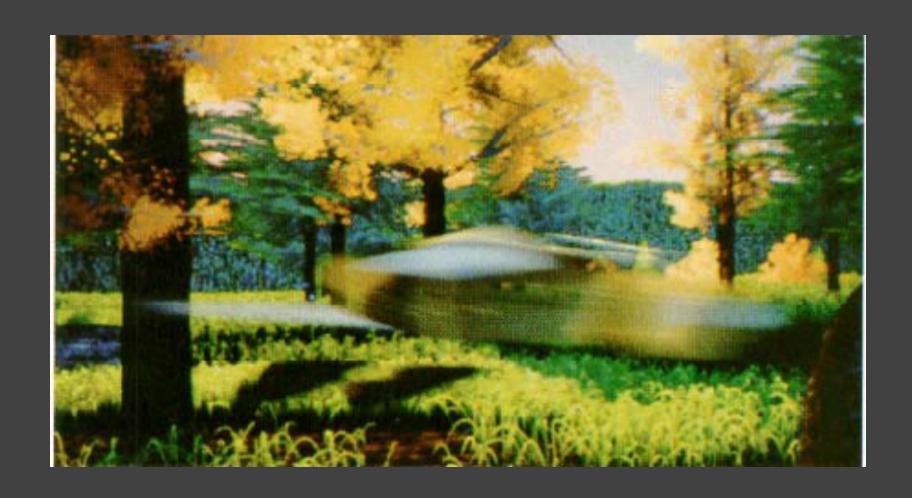

Linear interpolation is less pleasing

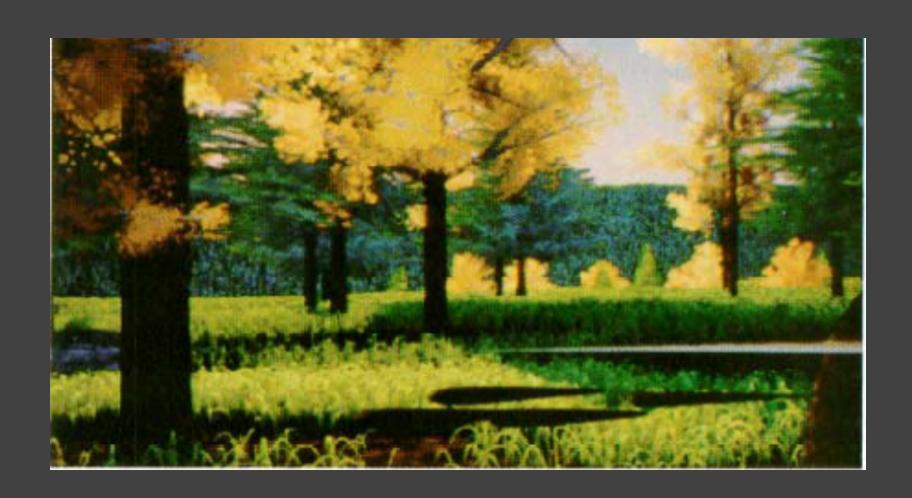

Principles for Animation

Animated Presentations

(Zongker & Salesin '03)

Make all movement meaningful

Avoid squash-and-stretch, exaggeration

Use anticipation and staging

Do one thing at a time

Principles for Animation

Congruence

Expressiveness

The structure and content of the external representation should correspond to the desired structure and content of the internal representation.

Apprehension

Effectiveness

The structure and content of the external representation should be readily and accurately perceived and comprehended.

[from Tversky 02]

Problems with Animation [Tversky]

Difficult to estimate paths and trajectories Motion is fleeting and transient Cannot simultaneously attend to multiple motions Parse motion into events, actions and behaviors Misunderstanding and wrongly inferring causality Anthropomorphizing physical motion may cause confusion or lead to incorrect conclusions

Administrivia

A3: Interactive Visualization

Create an interactive visualization application. Choose a data domain and an appropriate visualization technique.

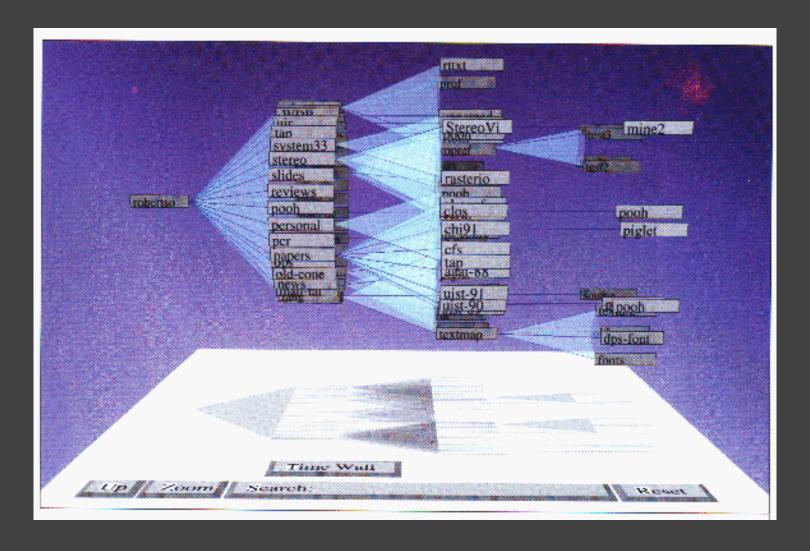

- 1. Choose a data set and storyboard your interface
- 2. Implement the interface using tools of your choice
- 3. Submit your application and produce a final write-up You should work in groups of 2-3.

Due by 5pm on Monday, May 4

Animated Transitions

Cone Trees [Robertson 91]

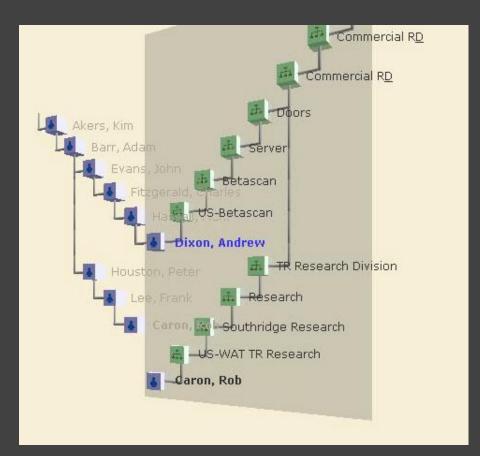

Polyarchies [Robertson 02]

Animate pivots across intersecting hierarchies.

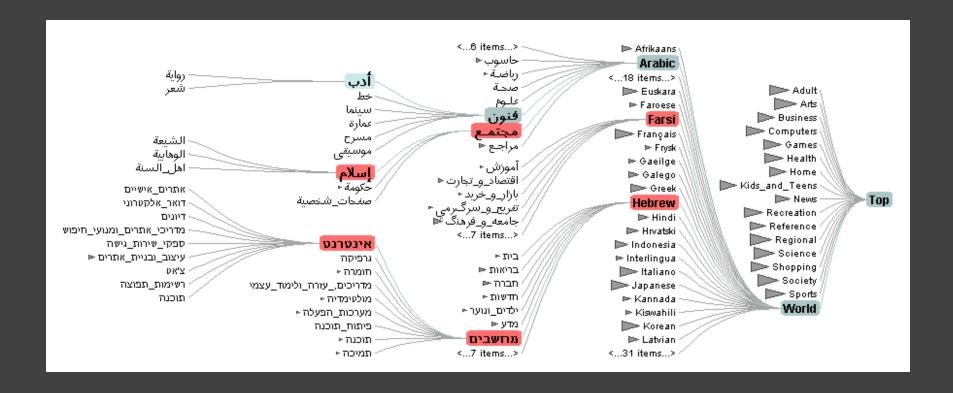

Tested a number of animation parameters.

Best duration: ~1 sec

Rotational movement degraded performance, translation preferred.

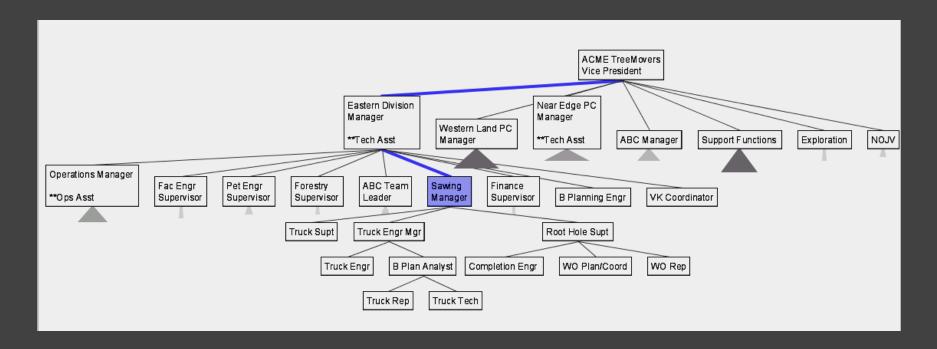

Degree-of-Interest Trees [Heer 04]

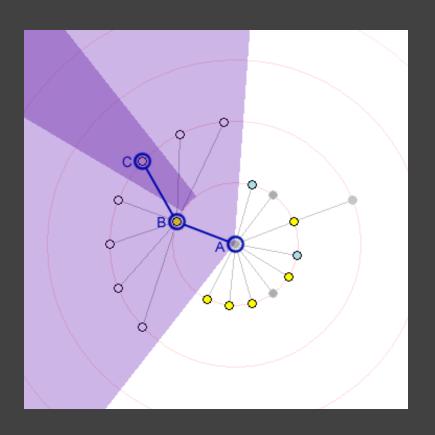

Animation of expanding/collapsing branches

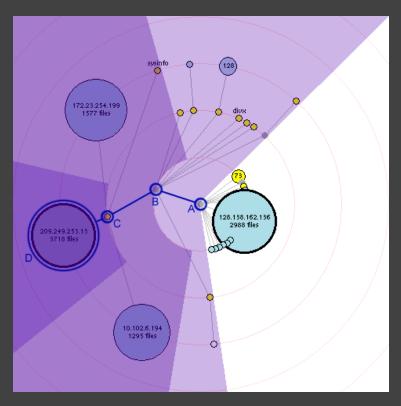

Space Tree [Grosjean 04]

Break animated transitions into discrete stages

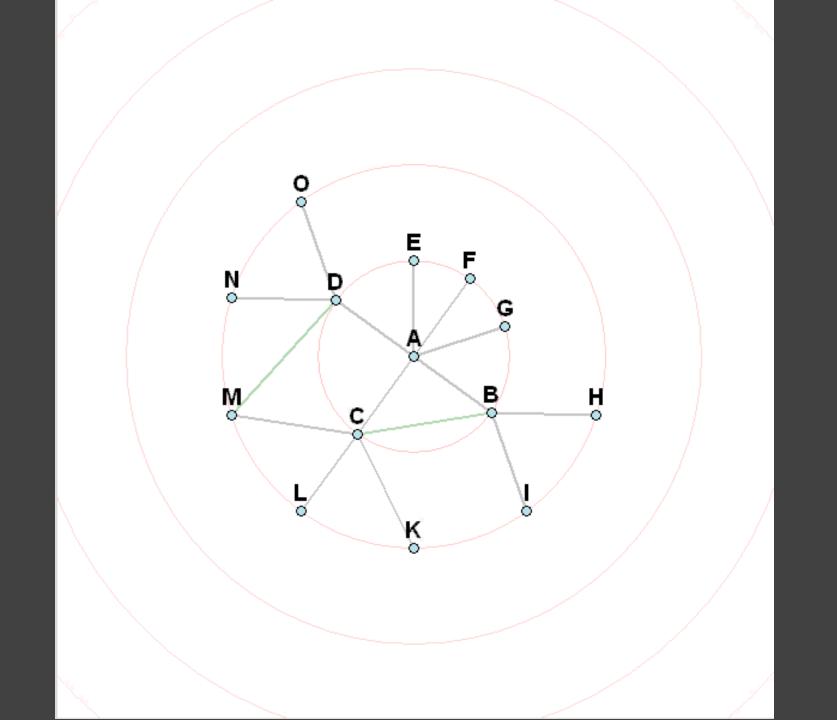

Radial Graph Layout

Optimize animation to aid comprehension

http://people.ischool.berkeley.edu/~rachna/gtv/

Animation in Radial Graph Layout

Help maintain context of nodes and general orientation of user during refocus.

Transition Paths

Linear interpolation of polar coordinates Node moves in an arc, not straight lines Moves along circle if not changing levels When changing levels, spirals to next ring

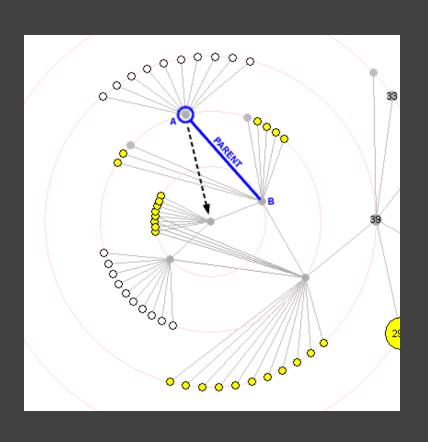

Animation in Radial Graph Layout

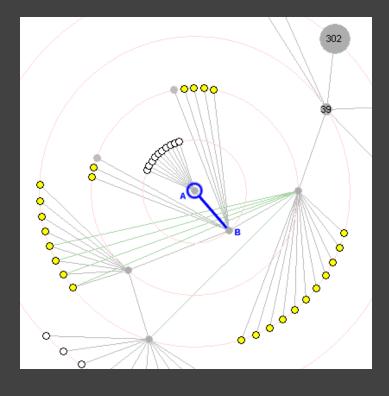

Transition constraints

Minimize rotational travel (move former parent away from new focus in same orientation)

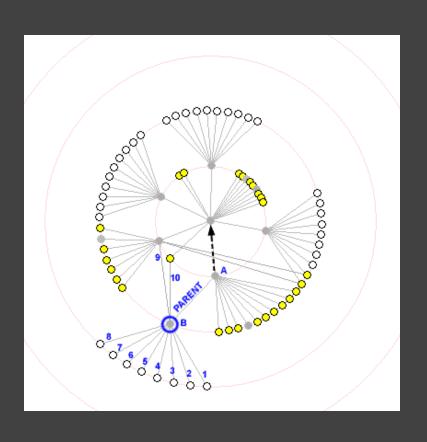

Avoid cross-over of edges

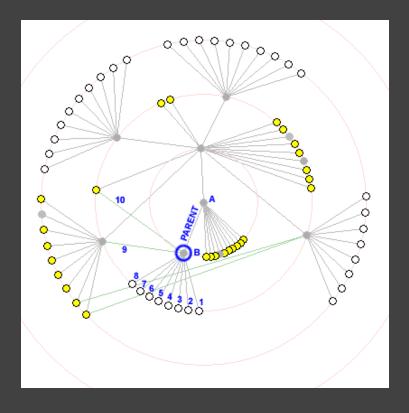

Retain Edge Orientation

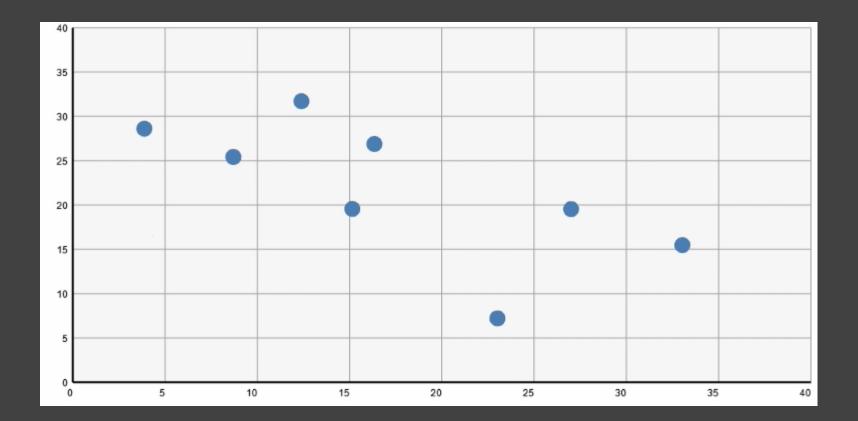

Retain Neighbor Order

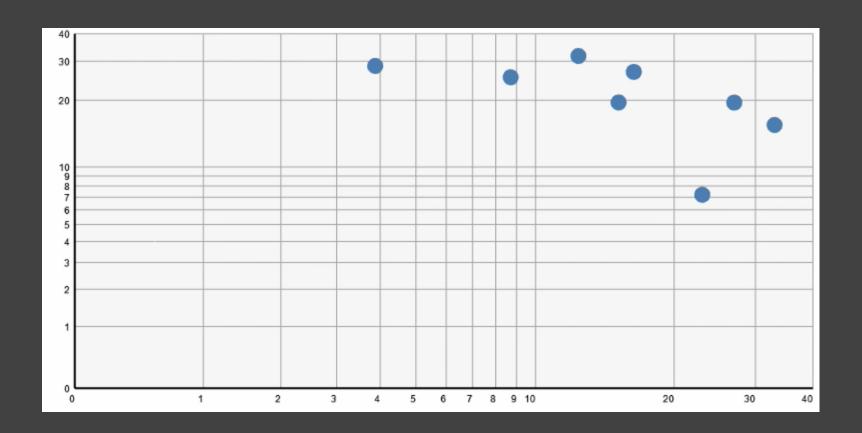

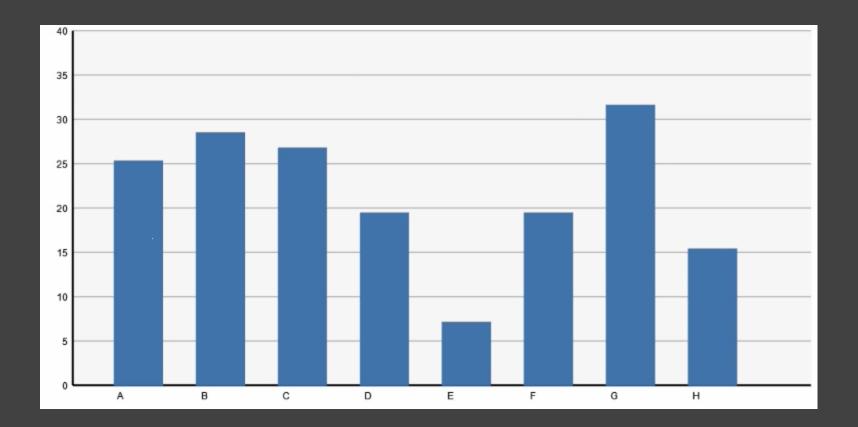

Animated Transitions in Statistical Graphics

Transitions between Data Graphics

During analysis and presentation it is common to transition between *related* data graphics.

Can animation help?
How does this impact perception?

Congruence

The structure and content of the external representation should correspond to the desired structure and content of the internal representation.

Apprehension

The structure and content of the external representation should be readily and accurately perceived and comprehended.

[from Tversky 02]

Congruence

Maintain valid data graphics during transitions
Use consistent syntactic/semantic mappings
Respect semantic correspondence
Avoid ambiguity

Apprehension

Group similar transitions
Minimize occlusion
Maximize predictability
Use simple transitions
Use staging for complex transitions
Make transitions as long as needed, but no longer

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Visual marks should always represent the same data tuple.

Congruence

Maintain valid data graphics during transitions
Use consistent syntactic/semantic mappings
Respect semantic correspondence

Avoid ambiguity —

Apprehension

Group similar transitions

Minimize occlusion

Maximize predictability

Use simple transitions

Use staging for complex transitions

Make transitions as long as needed, but no longer

Different operators should have distinct animations.

Congruence

Maintain valid data graphics during transitions
Use consistent syntactic/semantic mappings
Respect semantic correspondence
Avoid ambiguity

Apprehension

Group similar transitions

Minimize occlusion

Maximize predictability

Use simple transitions

Use staging for complex transitions

Make transitions as long as needed, but no longer

Objects are harder to track when occluded.

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions

Minimize occlusion

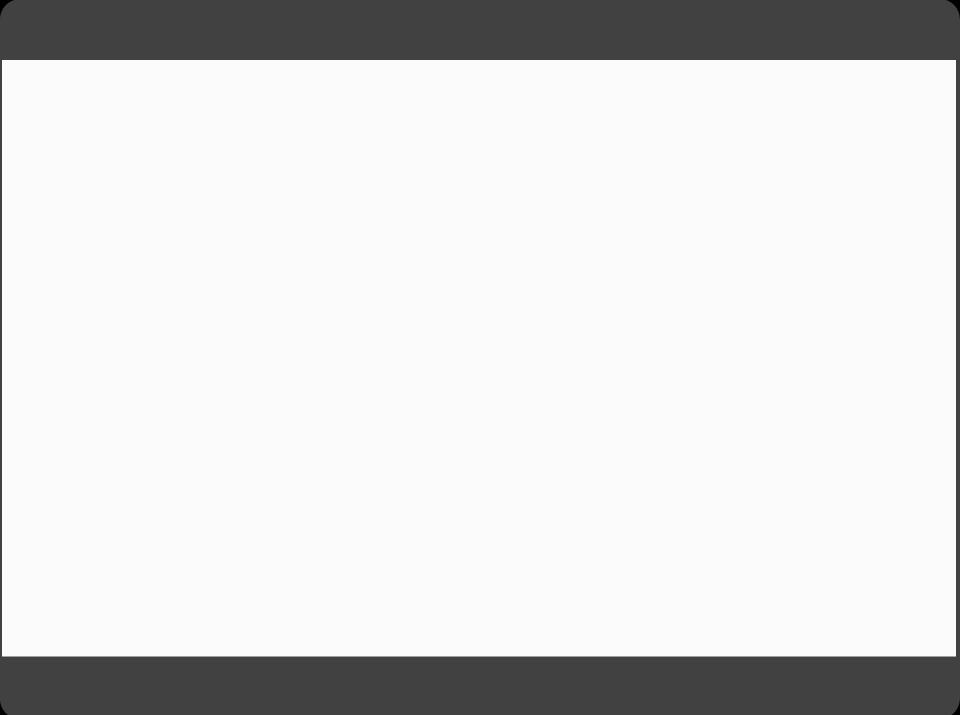

Maximize predictability

Use simple transitions

Use staging for complex transitions

Keep animation as simple as possible. If complicated, break into simple stages.

Make transitions as long as needed, but no longer

Study Conclusions

Appropriate animation improves graphical perception

Simple transitions beat "do one thing at a time"

Simple staging was preferred and showed benefits

but timing important and in need of study

Axis re-scaling hampers perception

Avoid if possible (use common scale)

Maintain landmarks better (delay fade out of lines)

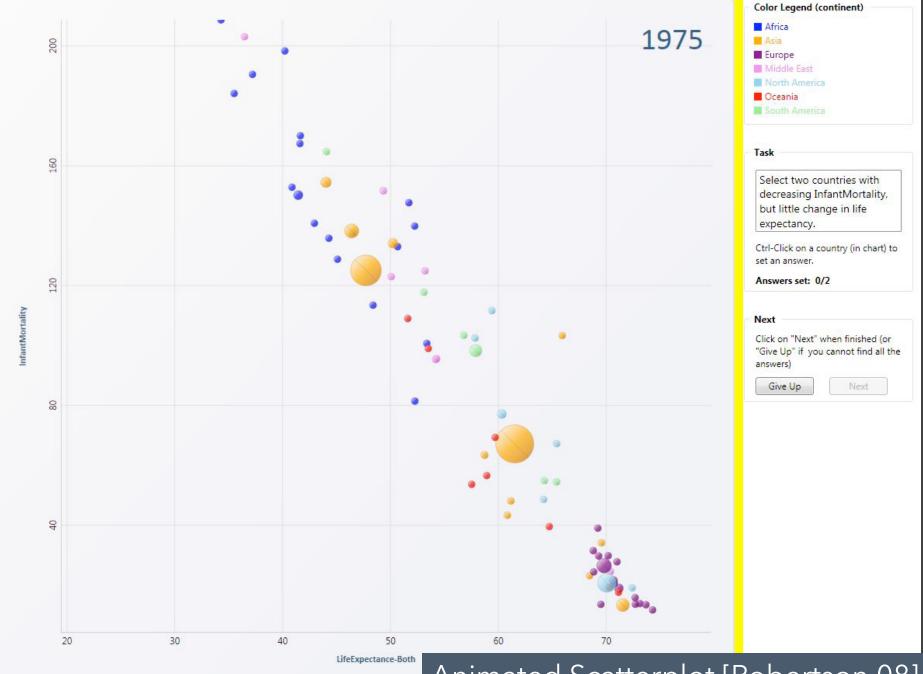

Subjects preferred animated transitions

Animation in Trend Visualization

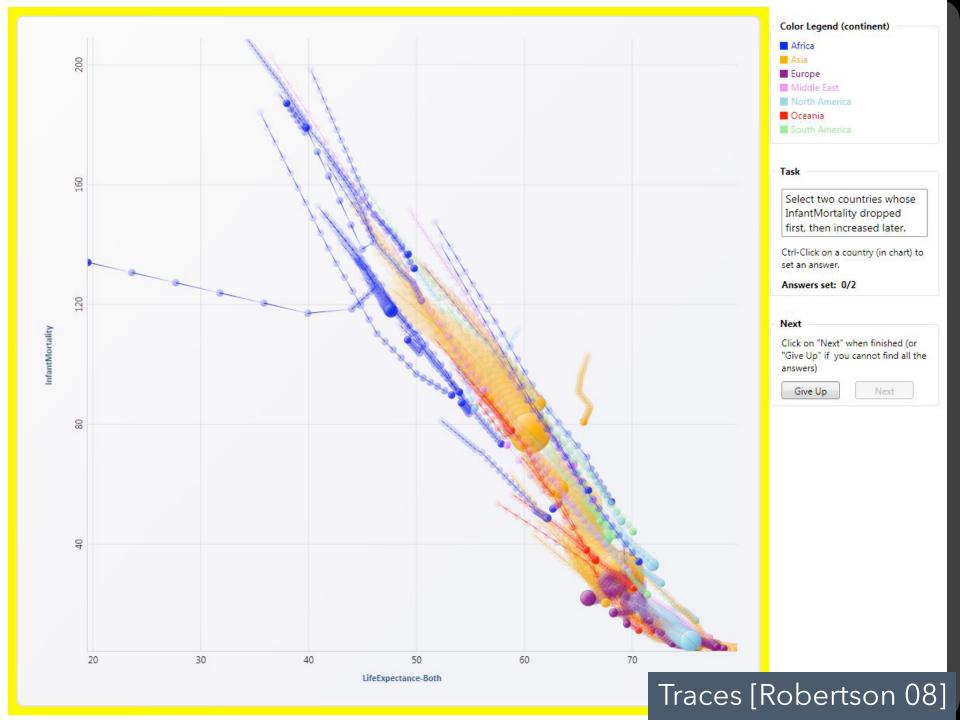

Heer & Robertson study found that animated transitions are better than static transitions for estimating changing values.

How does animation fare vs. static time-series depictions (as opposed to static transitions)?

Experiments by Robertson et al, InfoVis 2008

Animated Scatterplot [Robertson 08]

Algeria	Botswana	Burkina Faso	Cameroon	Central African Republic	Galobia	Ghxna	Guinea	Liberia

Study: Analysis & Presentation

Subjects asked comprehension questions. Presentation condition included narration.

Multiples 10% more accurate than animation

Presentation: Anim. 60% faster than multiples Analysis: Animation 82% slower than multiples

User preferences favor animation

Summary

Animation is a salient visual phenomenon

Attention, object constancy, causality, timing Design with care: congruence & apprehension

For processes, **static images** may be preferable

For transitions, animation has demonstrated benefits, but **consider task and timing**
