Topics

Motion perception Animated transitions in visualizations Implementing animations

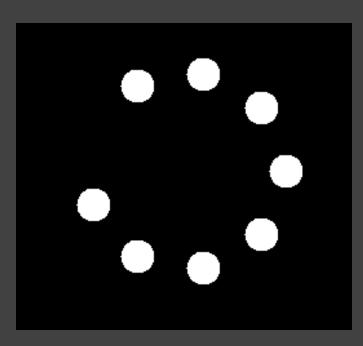

Motion Perception

Perceiving Animation

Under what conditions does a sequence of static images give rise to motion perception?

Motion is perceived at about ~10 frames/sec (100 ms).

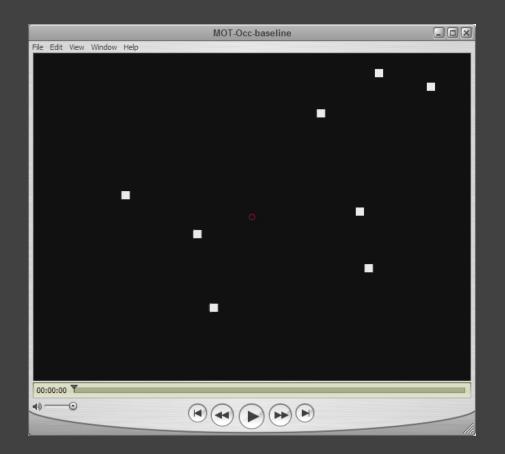

But this does not have to be smooth motion! We can tell that frames are discrete yet still perceive movement.

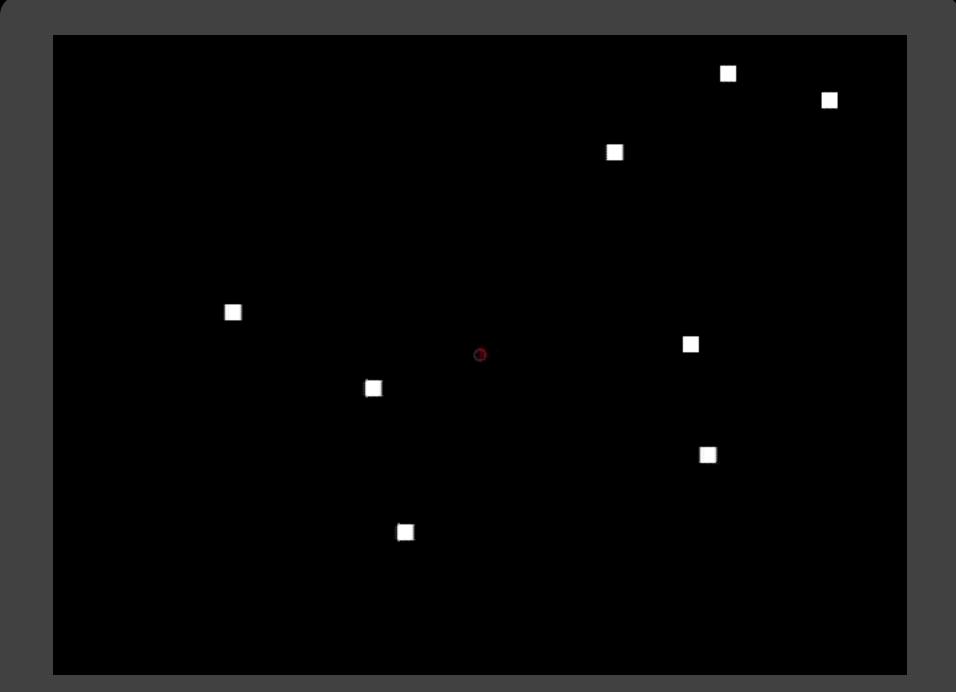

Motion as Visual Cue

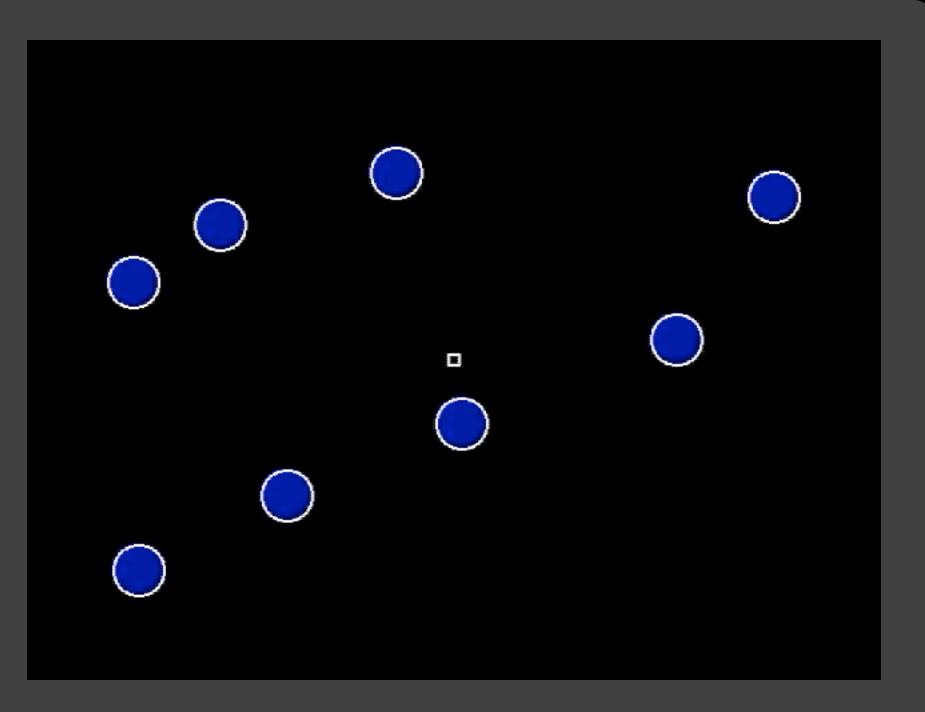

Pre-attentive, stronger than color, shape, ... More sensitive to motion at periphery Similar motions perceived as a group Motion parallax provide 3D cue (like stereopsis)

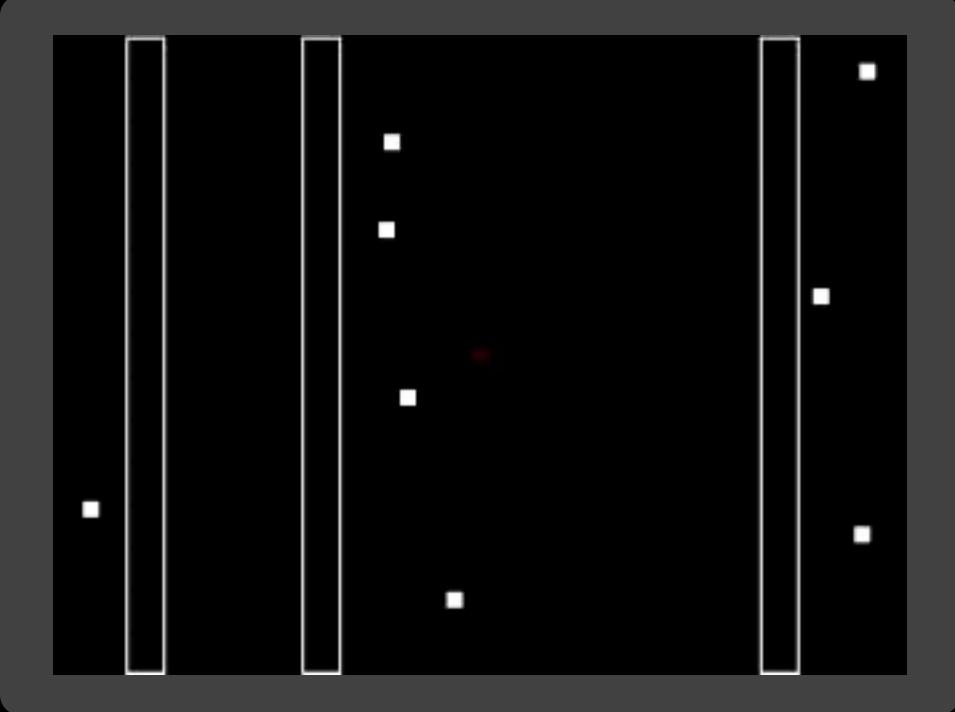

Tracking Multiple Targets

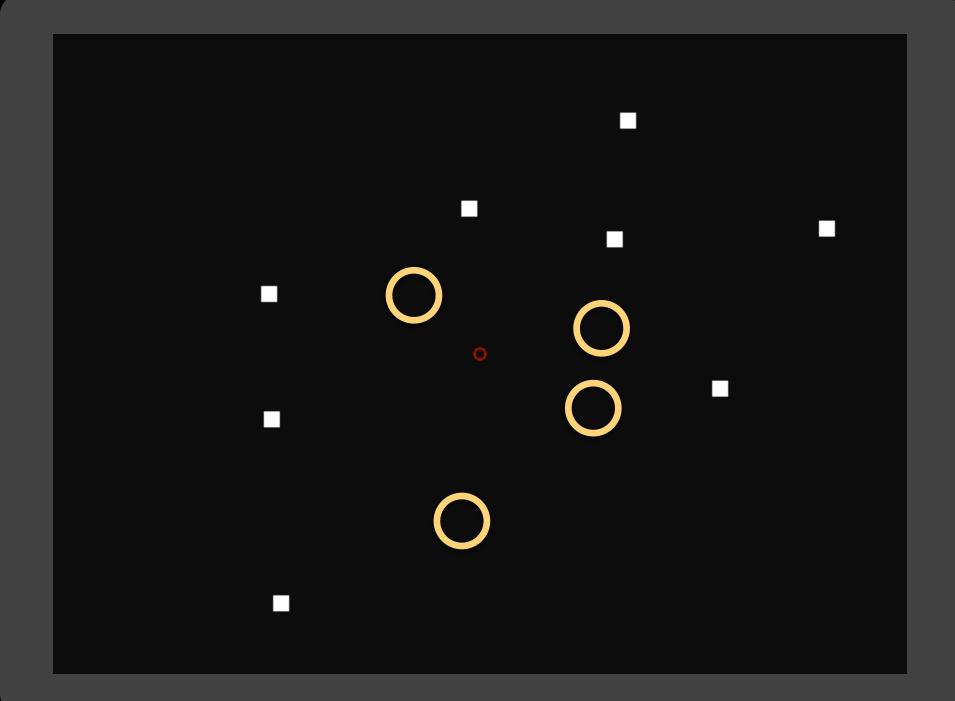

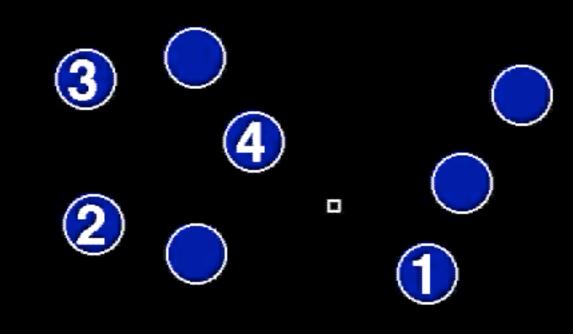

How many dots can we simultaneously track?

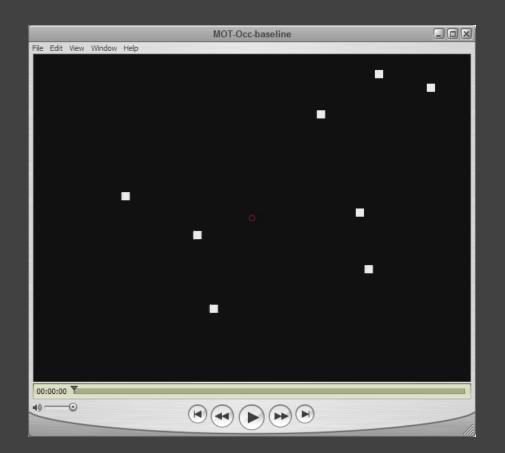

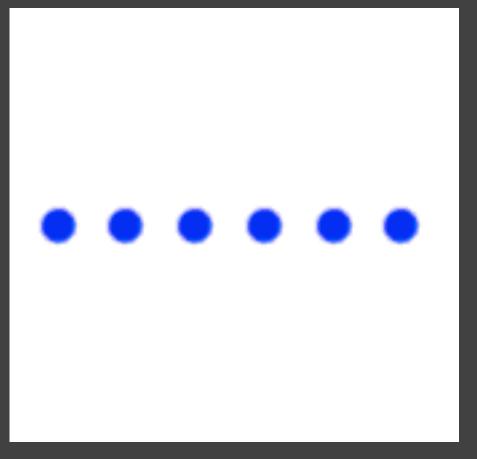

Tracking Multiple Targets

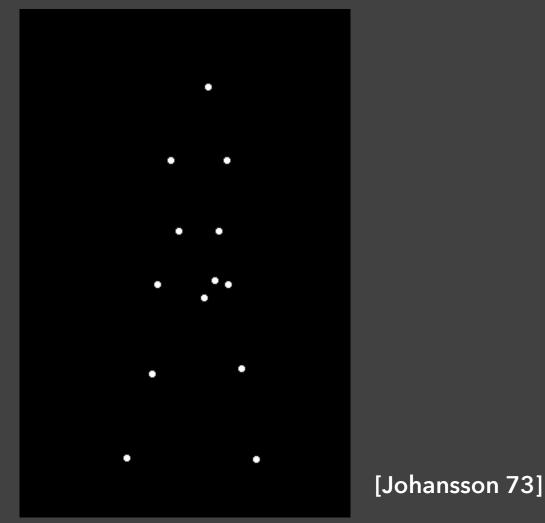

How many dots can we simultaneously track? ~4-6. Difficulty increases sig. at 6. [Yantis 92, Pylyshn 88, Cavanagh 05]

Grouped Dots Count as 1 Object

Dots moving together are grouped

Grouping of Biological Motion

Motions Show Transitions See change from one state to next

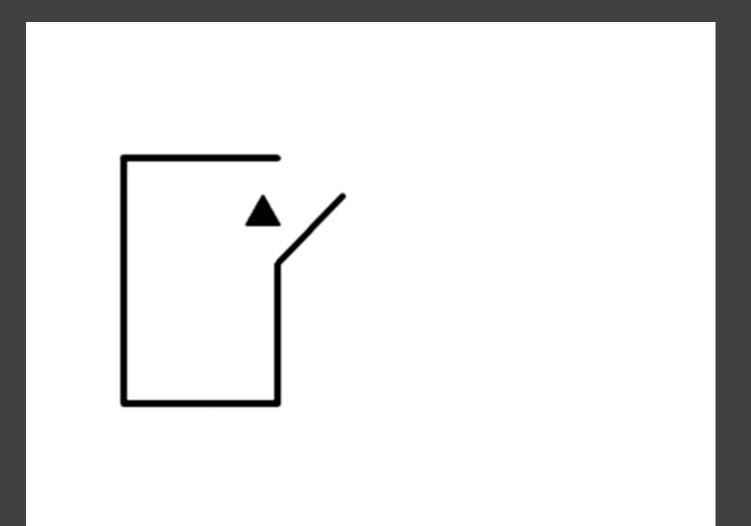

□ ○ ○ ○ start

end

Shows transition better, but

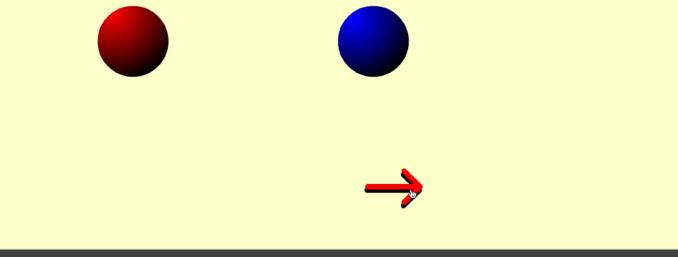

Still may be too fast, or too slow Too many objects may move at once

Constructing Narratives [Heider 44]

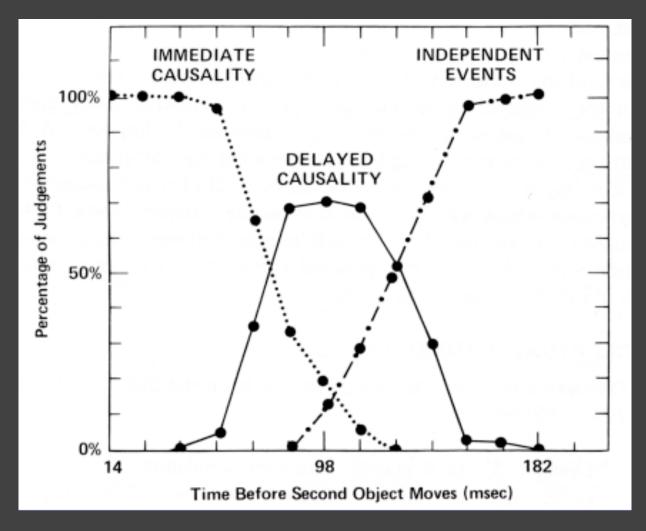

Attribution of Causality [Michotte 46]

Michotte demonstration 1. What do you see? Most observers report that "the red ball hit the blue ball." The blue ball moved "because the red ball hit it." Thus, the red ball is perceived to "cause" the blue ball to move, even though the balls are nothing more than color disks on your screen that move according to a programme.

Attribution of Causality [Michotte 46]

[Reprint from Ware 04]

Animation Helps?

Hurts?

Attention Constancy Causality Engagement Calibration direct attention distraction change tracking false relations cause and effect false agency increase interest "chart junk" too slow: boring

too fast: errors

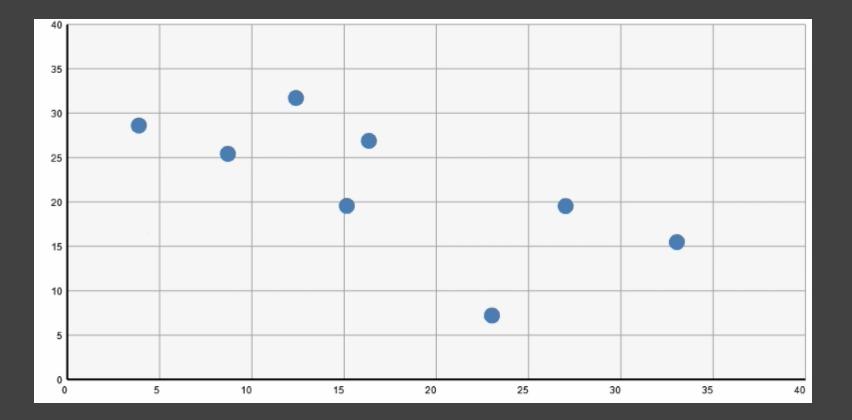

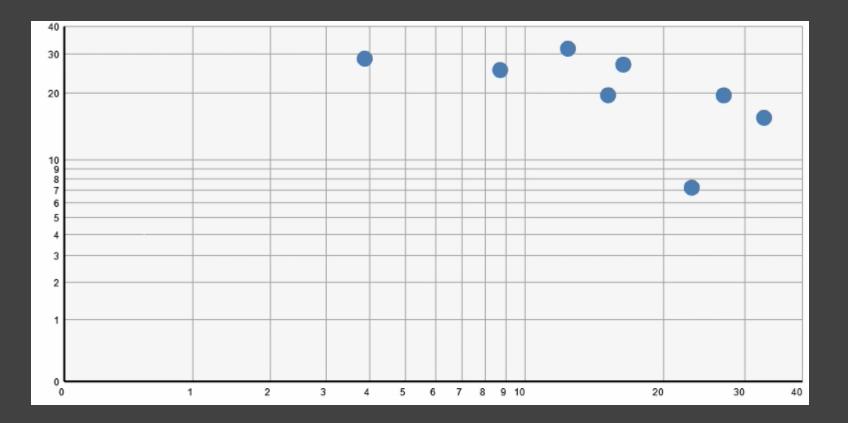

Problems with Animation [Tversky]

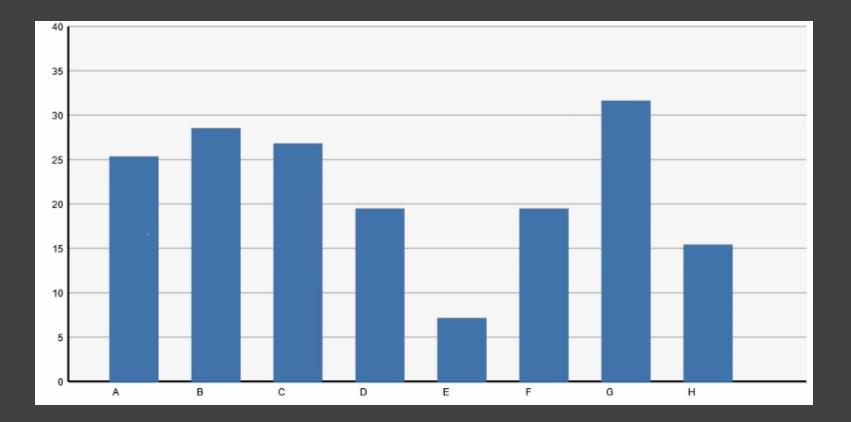

Difficult to estimate paths and trajectories Motion is fleeting and transient Cannot simultaneously attend to multiple motions Parse motion into events, actions and behaviors Misunderstanding and wrongly inferring causality Anthropomorphizing physical motion may cause confusion or lead to incorrect conclusions

Transitions between Data Graphics

During analysis and presentation it is common to transition between *related* data graphics.

Can animation help? How does this impact perception?

Principles for Animation

Congruence *Expressiveness?* The structure and content of the external representation should correspond to the desired structure and content of the internal representation.

ApprehensionEffectiveness?The structure and content of the externalrepresentation should be readily and accuratelyperceived and comprehended.[from Tversky 02]

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Visual marks should always represent the same data tuple.

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Different operators should have distinct animations.

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Objects are harder to track when occluded.

Congruence

Maintain valid data graphics during transitions Use consistent syntactic/semantic mappings Respect semantic correspondence Avoid ambiguity

Apprehension

Group similar transitions Minimize occlusion Maximize predictability Use simple transitions Use staging for complex transitions Make transitions as long as needed, but no longer

Keep animation as simple as possible. If complicated, break into simple stages.

Animated Transitions in Statistical Data Graphics

Jeffrey Heer George G. Robertson

Research

Study Conclusions

- Appropriate animation improves graphical perception
 Simple transitions beat "do one thing at a time"
 Simple staging was preferred and showed benefits but timing important and in need of study
 Axis re-scaling hampers perception Avoid if possible (use common scale)
 - Maintain landmarks better (delay fade out of lines)

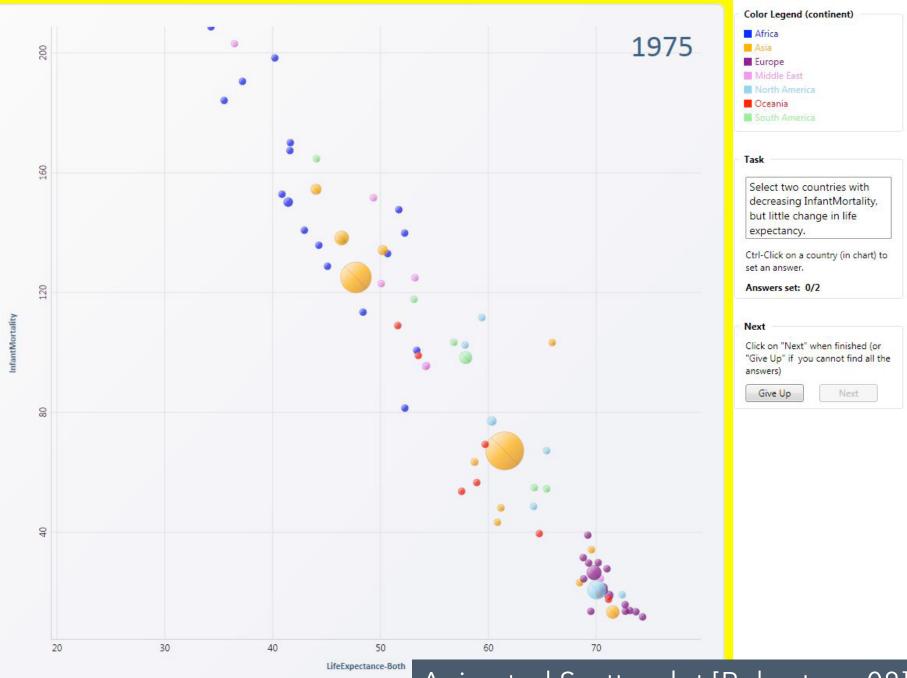

Subjects preferred animated transitions

Animation in Trend Visualization

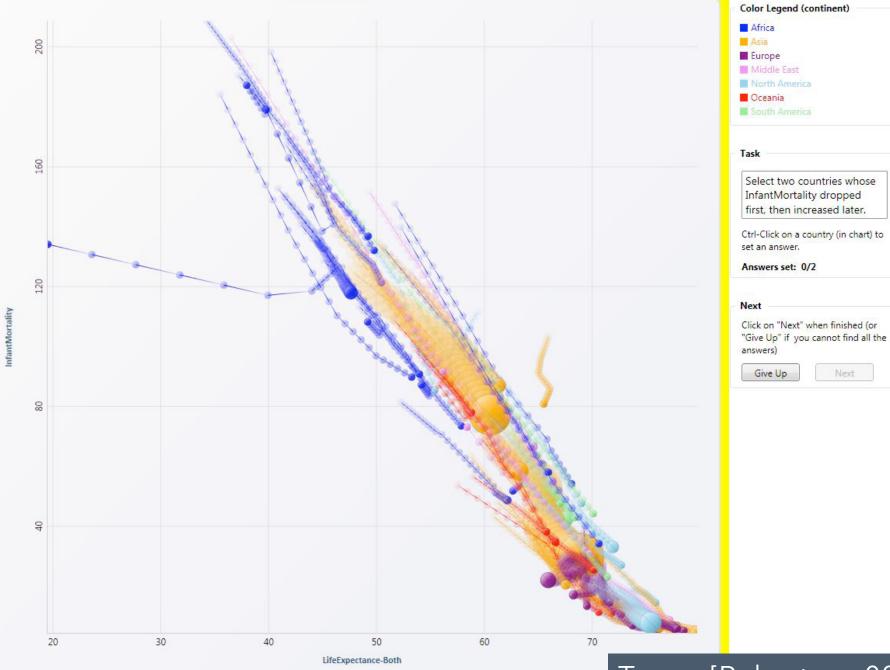

Heer & Robertson study found that animated transitions are better than static transitions for estimating changing values.

How does animation fare vs. static time-series depictions (as opposed to static transitions)?

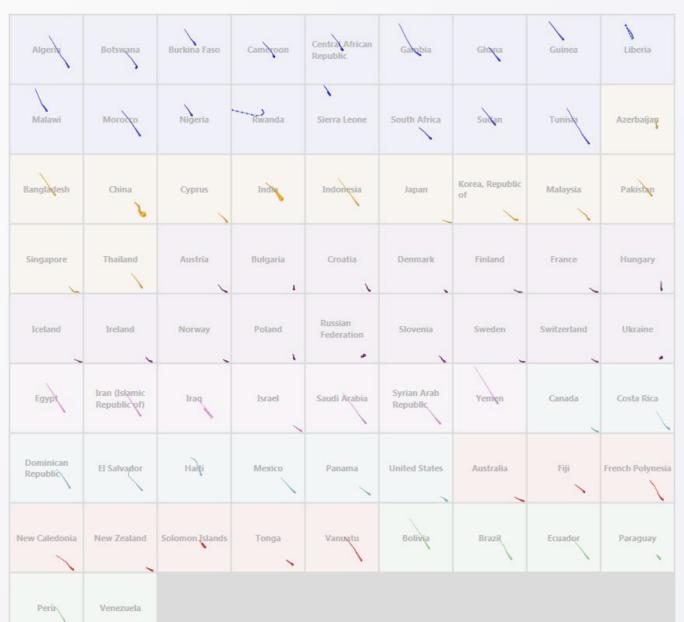

Experiments by Robertson et al, InfoVis 2008 (10 Year Test-of-Time Award at InfoVis 2018!)

Which to prefer for analysis? <u>For pre</u>sentation?

Study: Analysis & Presentation

Subjects asked comprehension questions. Presentation condition included narration.

Multiples 10% more accurate than animation

Presentation: Anim. 60% *faster* than multiples *Analysis*: Animation 82% *slower* than multiples

User preferences favor animation (even though less accurate and slower for analysis!)

Administrivia

A3: Interactive Prototype

Create an interactive visualization. Choose a driving question for a dataset and develop an appropriate visualization + interaction techniques, then deploy your visualization on the web. Due by *11:59pm* on **Monday, May 10**. <u>Work in project teams of 3-4 people</u>.

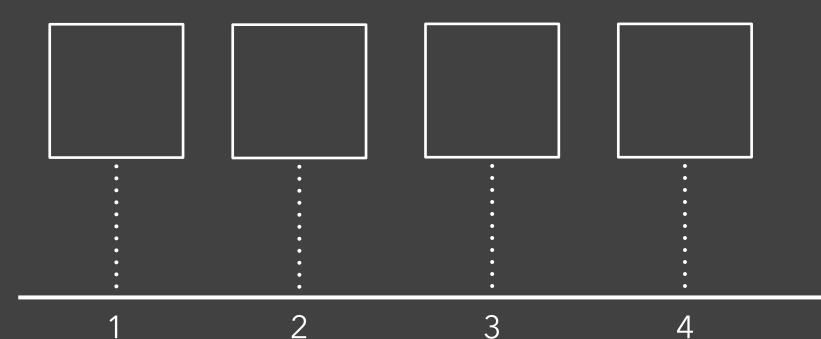

Break Time!

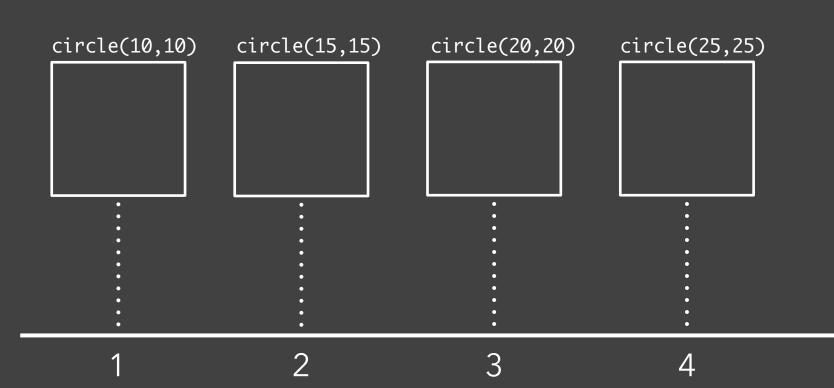

Implementing Animation

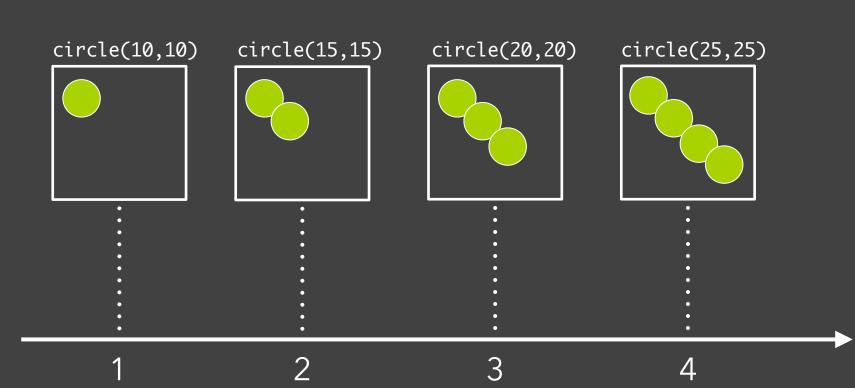

Animation Approaches

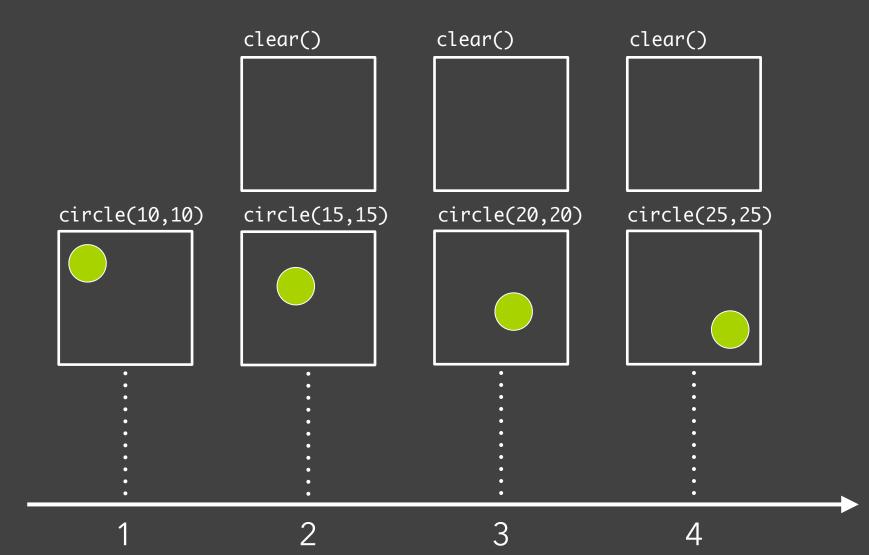

Frame-Based Animation

Redraw scene at regular interval (e.g., 16ms) Developer defines the redraw function

Animation Approaches

Frame-Based Animation

Redraw scene at regular interval (e.g., 16ms) Developer defines the redraw function

Transition-Based Animation (Hudson & Stasko '93)
Specify property value, duration & easing
Also called tweening (for "in-betweens")
Typically computed via interpolation
step(fraction) { x_{now} = x_{start} + fraction * (x_{end} - x_{start}); }
Timing & redraw managed by UI toolkit

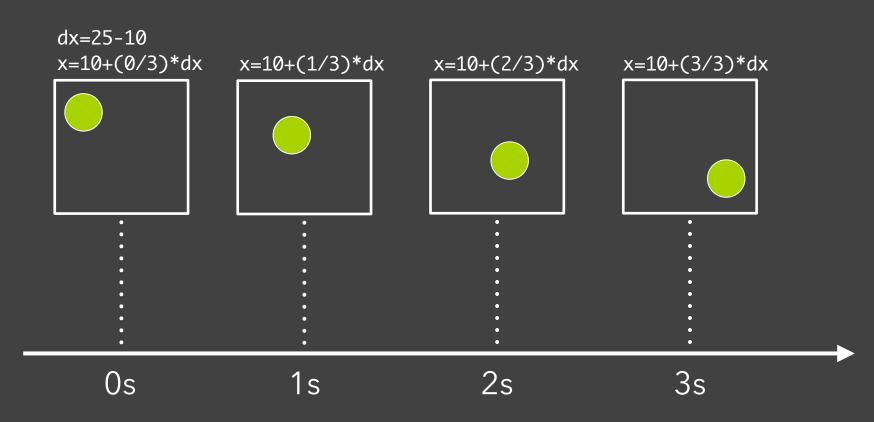

Transition-Based Animation

from: (10,10) to: (25,25) duration: 3sec

Transition-Based Animation

from: (10,10) **to:** (25,25) **duration:** 3sec Toolkit handles frame-by-frame updates!

Any d3 *selection* can be used to drive animation.

Any d3 *selection* can be used to drive animation.

// Select SVG rectangles and bind them to data values.
var bars = svg.selectAll("rect.bars").data(values);

Any d3 *selection* can be used to drive animation.

// Select SVG rectangles and bind them to data values.
var bars = svg.selectAll("rect.bars").data(values);

// Static transition: update position and color of bars.

bars

.attr("x", d => xScale(d.foo))
.attr("y", d => yScale(d.bar))
.style("fill", d => colorScale(d.baz));

Any d3 *selection* can be used to drive animation.

// Select SVG rectangles and bind them to data values.
var bars = svg.selectAll("rect.bars").data(values);

// Animated transition: interpolate to target values using default timing bars.transition()

.attr("x", d => xScale(d.foo))
.attr("y", d => yScale(d.bar))
.style("fill", d => colorScale(d.baz));

// Animated transition: interpolate to target values using default timing bars.transition()

.attr("x", d => xScale(d.foo))
.attr("y", d => yScale(d.bar))
.style("fill", d => colorScale(d.baz));

// Animation is implicitly queued to run!

D3 Transitions, Continued

bars.transition()
.duration(500) // animation duration in milliseconds
.delay(0) // onset delay in milliseconds
.ease(d3.easeBounce) // set easing (or "pacing") style
.attr("x", (d) => xScale(d.foo))

D3 Transitions, Continued

bars.transition()
.duration(500) // animation duration in milliseconds
.delay(0) // onset delay in milliseconds
.ease(d3.easeBounce) // set easing (or "pacing") style
.attr("x", (d) => xScale(d.foo))

bars.exit().transition() // animate elements leaving the display
.style("opacity", 0) // fade out to fully transparent
.remove(); // remove from DOM upon completion

Easing (or "Pacing") Functions

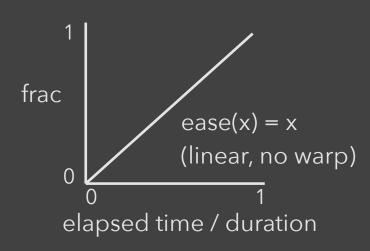

Goals: stylize animation, improve perception.

Basic idea is to warp time: as *duration* goes from start (0%) to end (100%), dynamically adjust the *interpolation fraction* using an **easing function**.

Easing (or "Pacing") Functions

Summary

Animation is a salient visual phenomenon Attention, object constancy, causality, timing Design with care: congruence & apprehension

For transitions, animation has demonstrated benefits, but **consider task and timing**
