CSE 512 - Data Visualization

Color

Jeffrey Heer University of Washington

Purpose of Color

To label
To measure
To represent and imitate
To enliven and decorate

"Above all, do no harm." - Edward Tufte

Topics

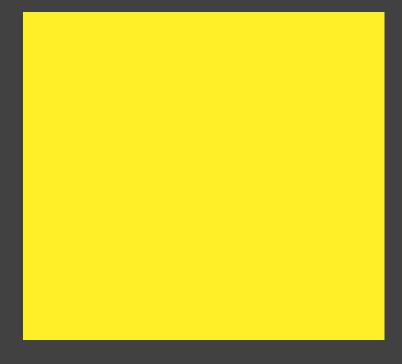

Perception of Color

Light, Visual system, Mental models

Color in Information Visualization

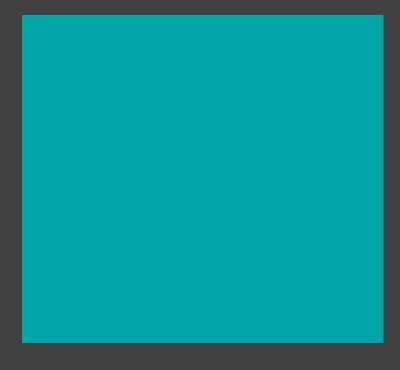

Categorical & Quantitative encoding Guidelines for color palette design

Perception of Color

Display Gamuts

Typically defined by:

3 Colorants

Convex region

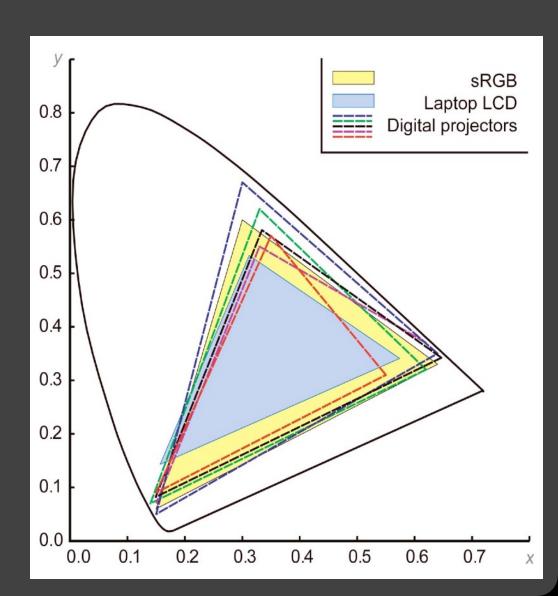

Display Gamuts

Deviations from sRGB specification

Example:

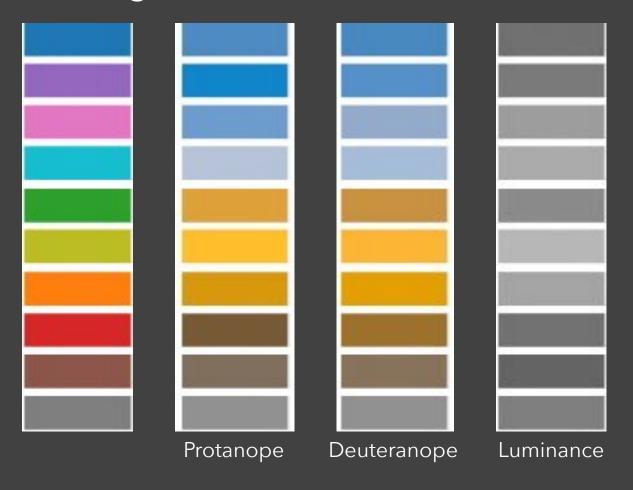

(R, G, B) coordinates ranging from 0-255.

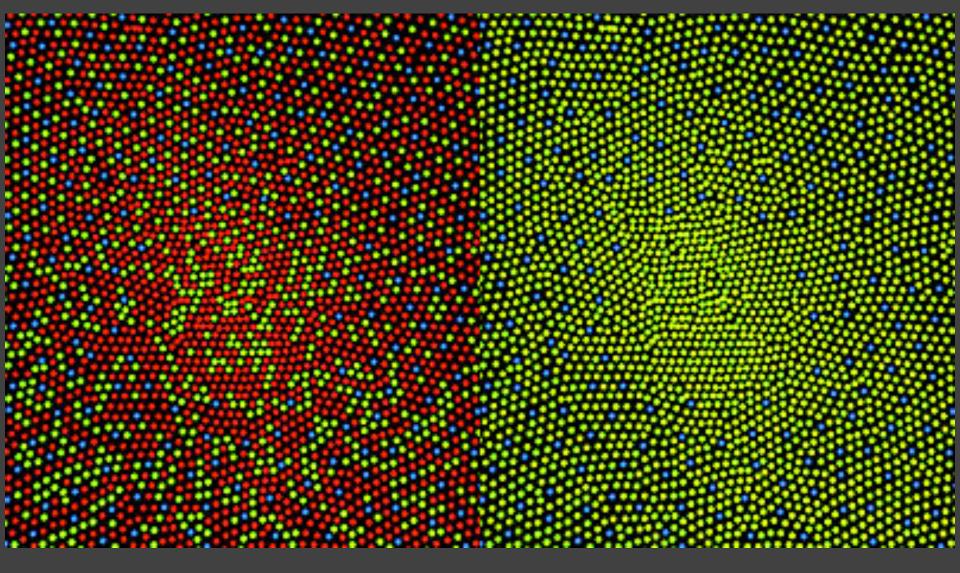

Displays may produce different colors for a coord!

Color Vision Deficiency (CVD)

Missing one or more cones or rods in retina.

Normal Retina

Protanopia

Color Vision Simulators

Simulate color vision deficiencies

Browser plug-ins Photoshop plug-ins, etc.

Color Perception

Primary Colors

To paint "all colors":

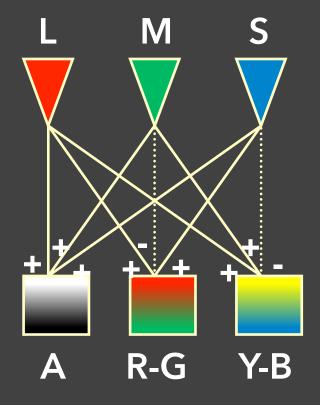

Leonardo da Vinci, circa 1500 described in his notebooks a list of simple colors...

Yellow Blue Green Red

Opponent Processing

LMS are combined to create:

Lightness Red-green contrast Yellow-blue contrast

[Fairchild]

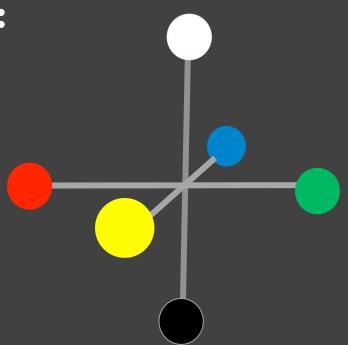

Opponent Processing

LMS are combined to create:

Lightness

Red-green contrast

Yellow-blue contrast

Opponent Processing

LMS are combined to create:

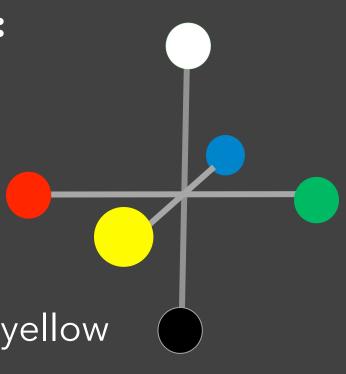

Lightness

Red-green contrast

Yellow-blue contrast

Experiments:

No reddish-green, no blueish-yellow Color after images

CIE LAB Color Space

Axes correspond to opponent signals

L* = Luminance

a* = Red-green contrast

b* = Yellow-blue contrast

Much more perceptually uniform than RGB!

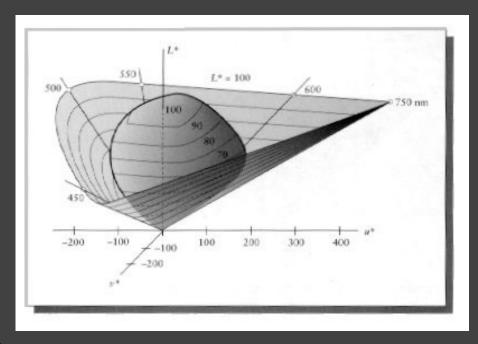

Scaling of axes to represent "color distance" JND = Just noticeable difference (~2.3 units)

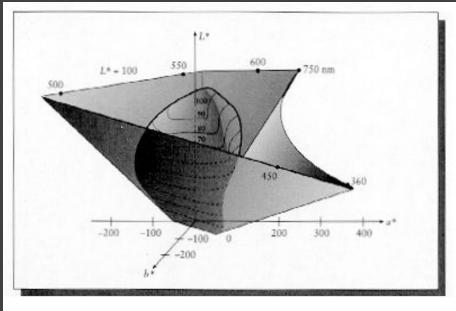

D3 + Vega include LAB color space support

CIE LAB and LUV Color Spaces

Standardized in 1976 to mathematically represent opponent processing theory.

Non-linear transformation of CIE XYZ

CIE LAB Color Space

Axes correspond to opponent signals

L* = Luminance

a* = Red-green contrast

b* = Yellow-blue contrast

Much more perceptually uniform than sRGB!

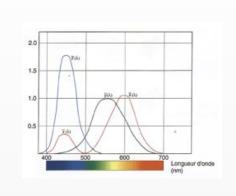

Scaling of axes to represent "color distance" JND = Just noticeable difference (~2.3 units)

D3 + Vega include LAB color space support!

"Yellow"

Color Cognition

Color Appearance

If we have a perceptually-uniform color space, can we predict how we perceive colors?

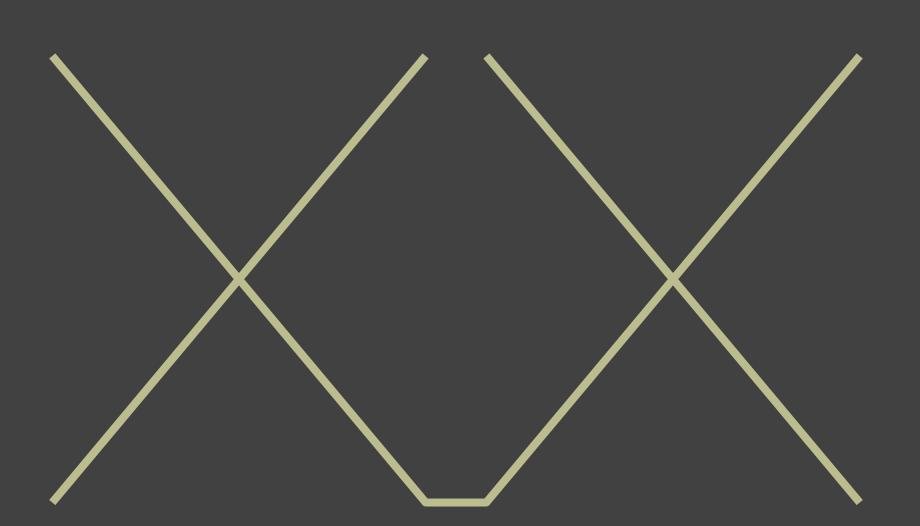

"In order to use color effectively it is necessary to recognize that it deceives continually."

- Josef Albers, Interaction of Color

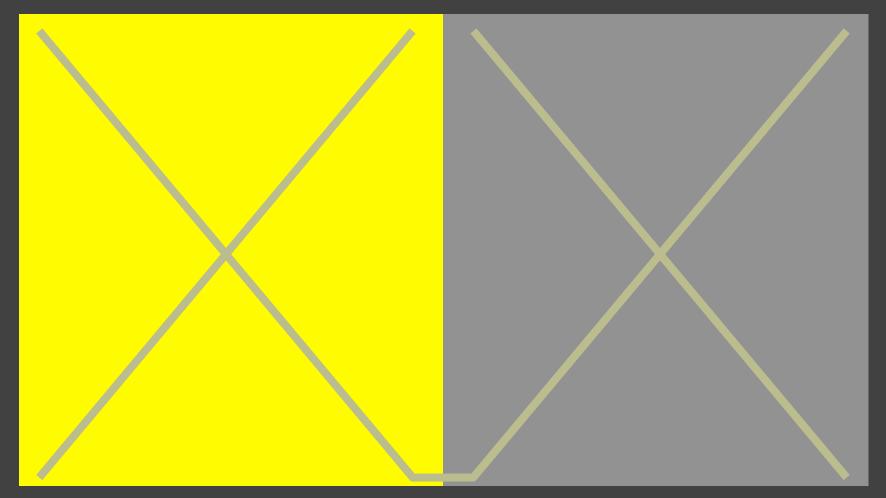

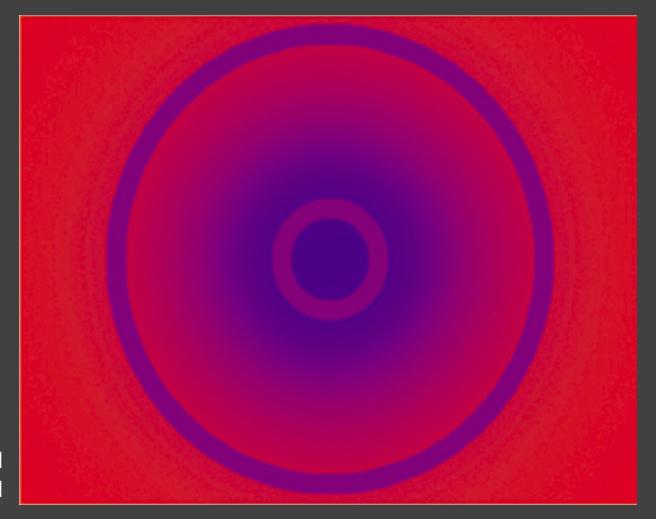

Simultaneous Contrast

Simultaneous Contrast

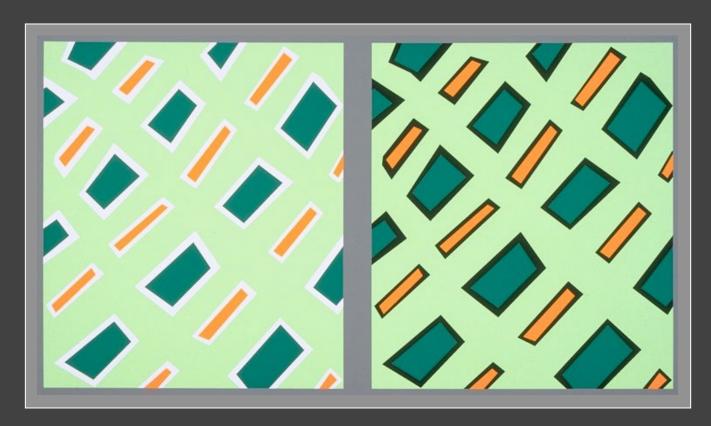

Inner & outer rings are the same physical purple.

Donald MacLeod

Bezold Effect

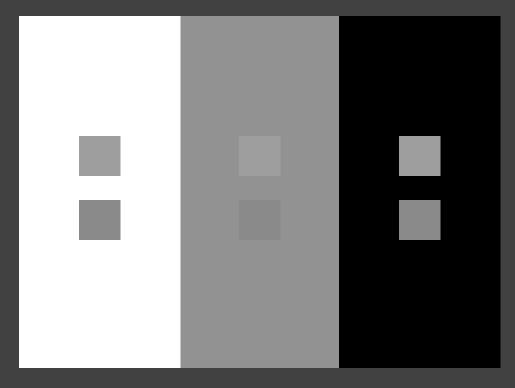

Color appearance depends on adjacent colors

Color Appearance Tutorial by Maureen Stone

Crispening

Perceived difference depends on background

Basic Color Terms

Chance discovery by Brent Berlin and Paul Kay.

Basic Color Terms

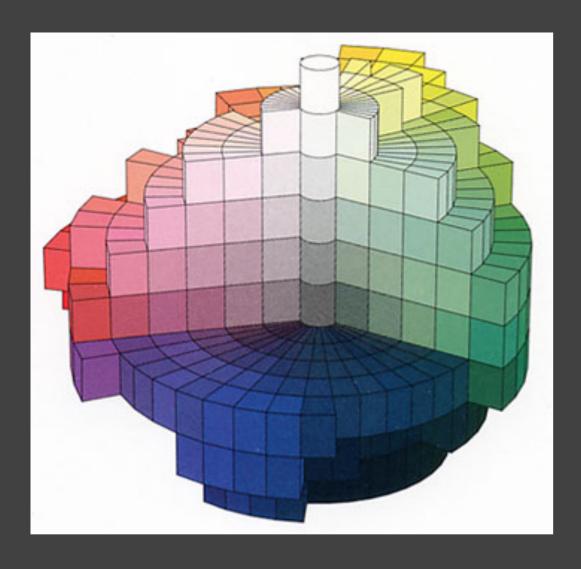

Chance discovery by Brent Berlin and Paul Kay.

Initial study in 1969

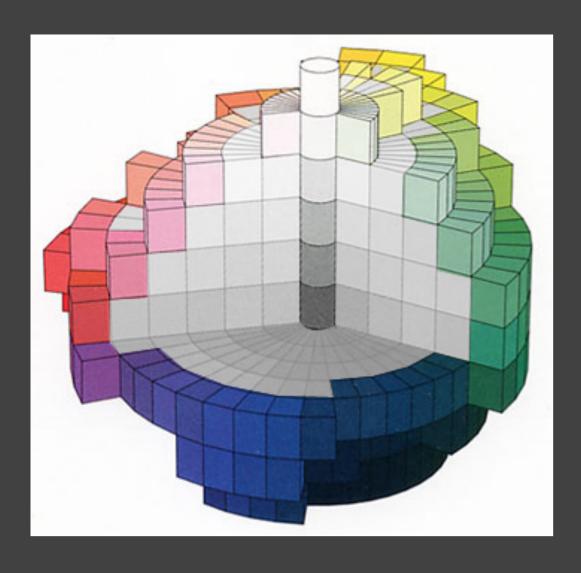

Surveyed speakers from 20 languages

Literature from 69 languages

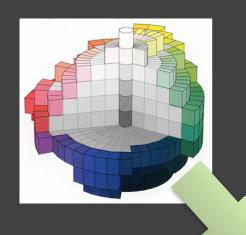

World Color Survey

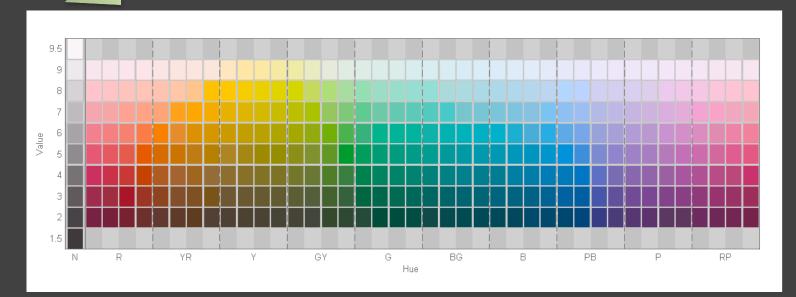

World Color Survey

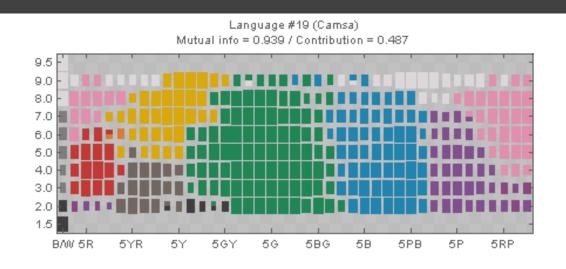

World Color Survey

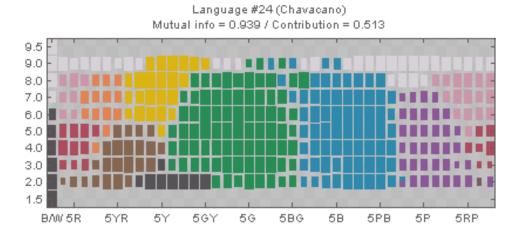

Naming information from 2,616 speakers from 110 languages on 330 Munsell color chips

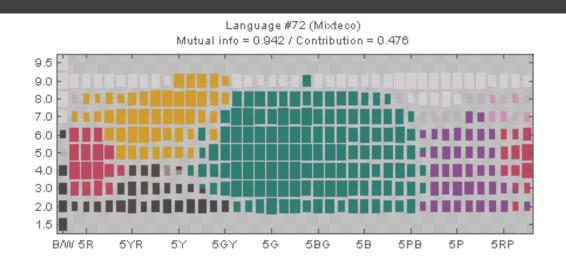

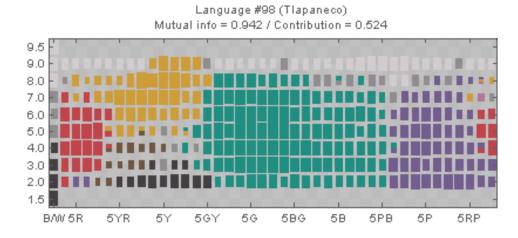

Results from WCS

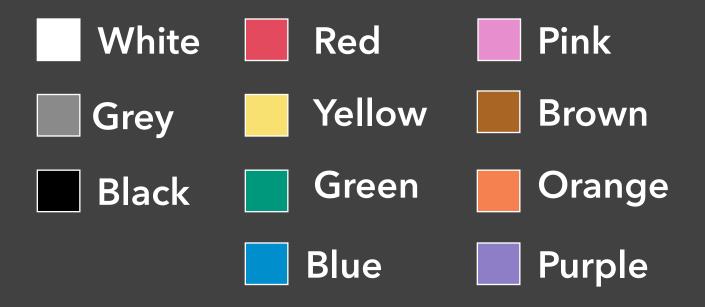

Results from WCS

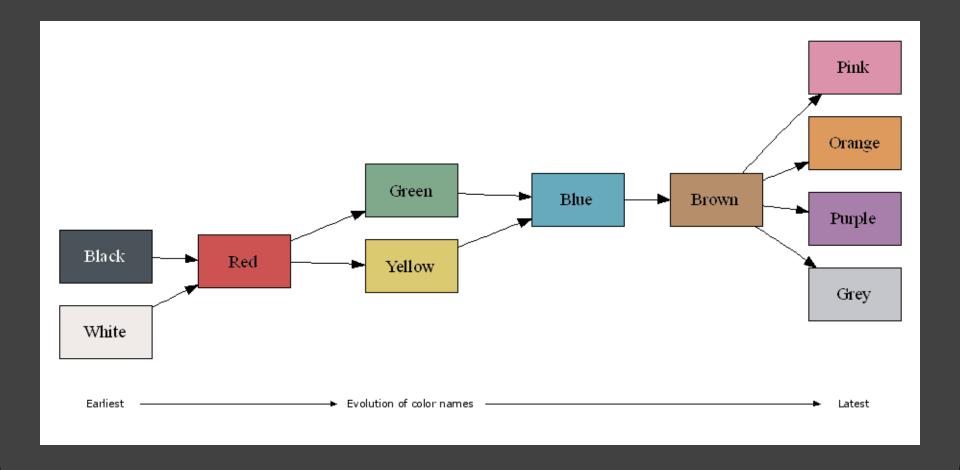

Universal (?) Basic Color Terms

Basic color terms recur across languages.

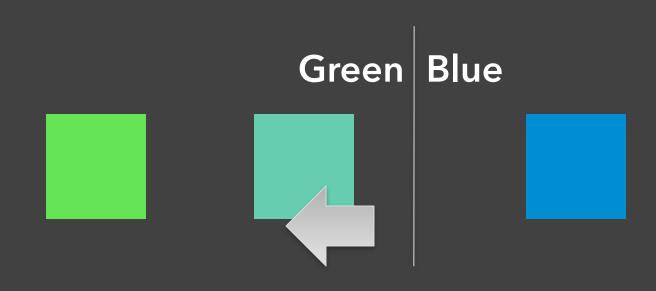

Evolution of Basic Color Terms

Proposed term evolution across languages.

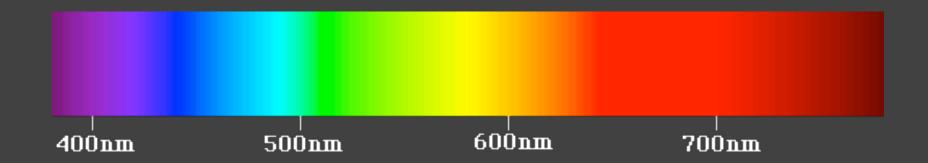

Naming Effects Color Perception

Color name boundaries

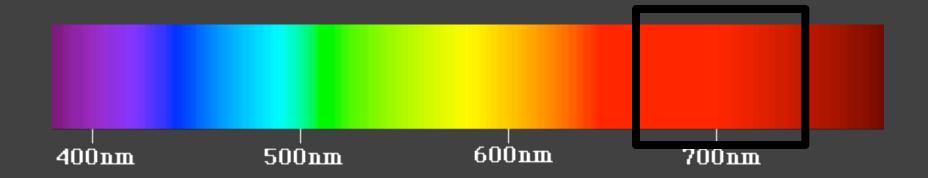

Rainbow Color Map

We associate and group colors together, often using the name we assign to the colors.

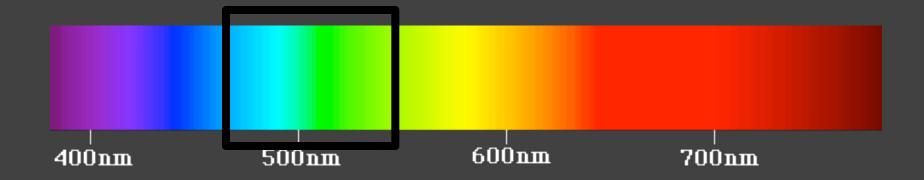

Rainbow Color Map

We associate and group colors together, often using the name we assign to the colors.

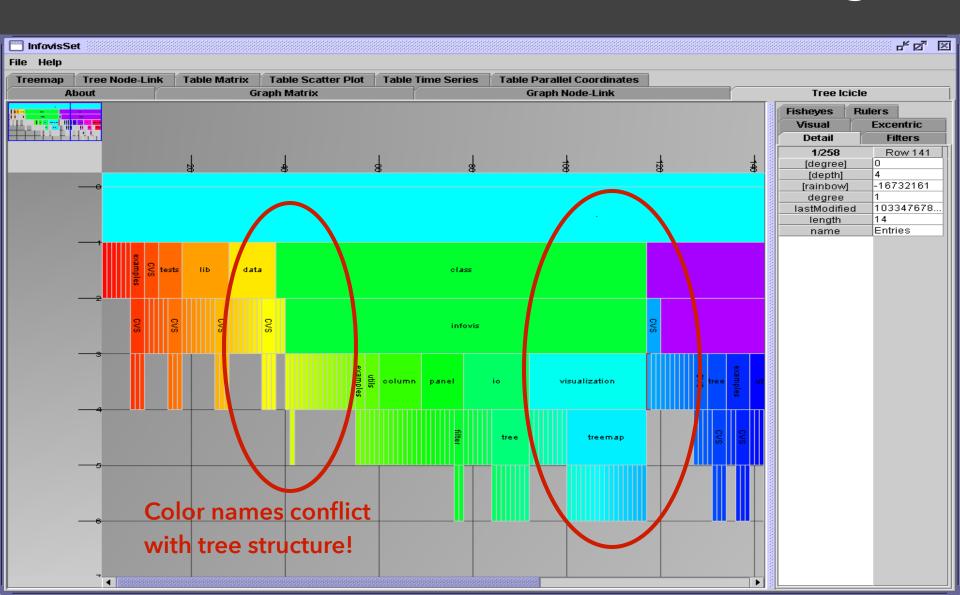

Rainbow Color Map

We associate and group colors together, often using the name we assign to the colors.

Icicle Tree with Rainbow Coloring

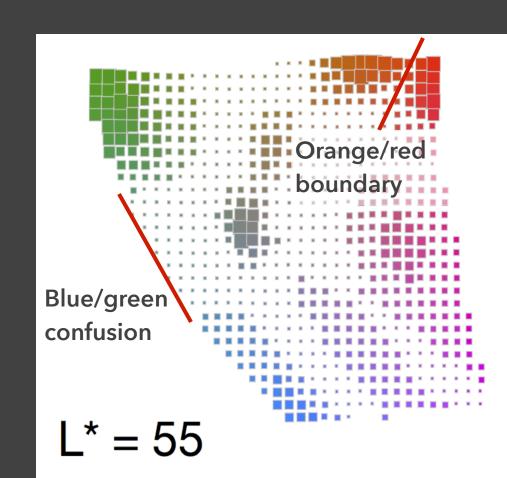

Color Naming Models [Heer & Stone '12]

Model 3 million responses from XKCD survey

Bins in LAB space sized by *saliency*:

How much do people agree on color name?

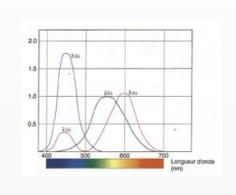

Modeled by entropy of *p*(*name* | *color*)

Palette Design & Color Names

Minimize overlap and ambiguity of colors.

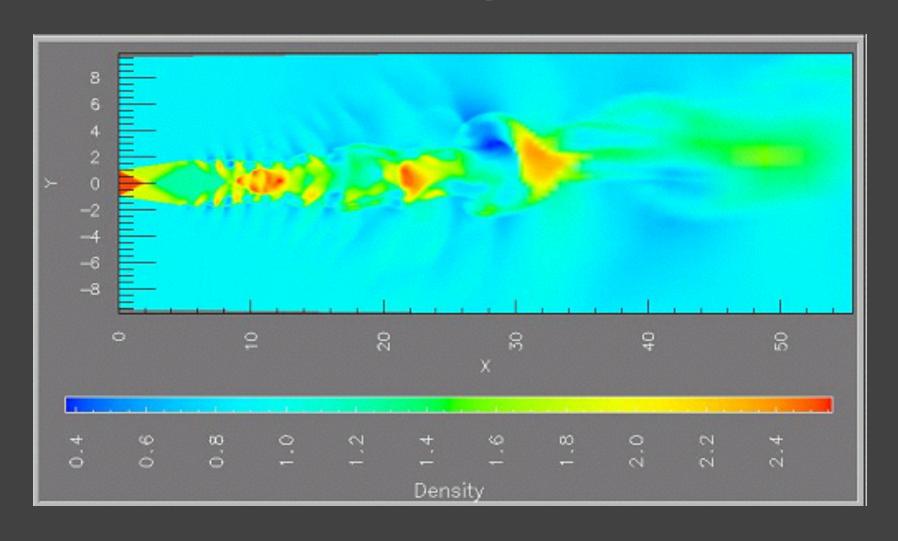

Palette Design & Color Names

Minimize overlap and ambiguity of colors.

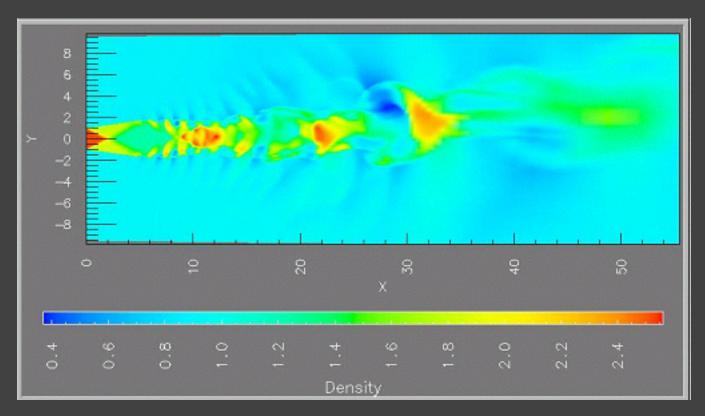

Quantitative Color

Rainbow Color Maps

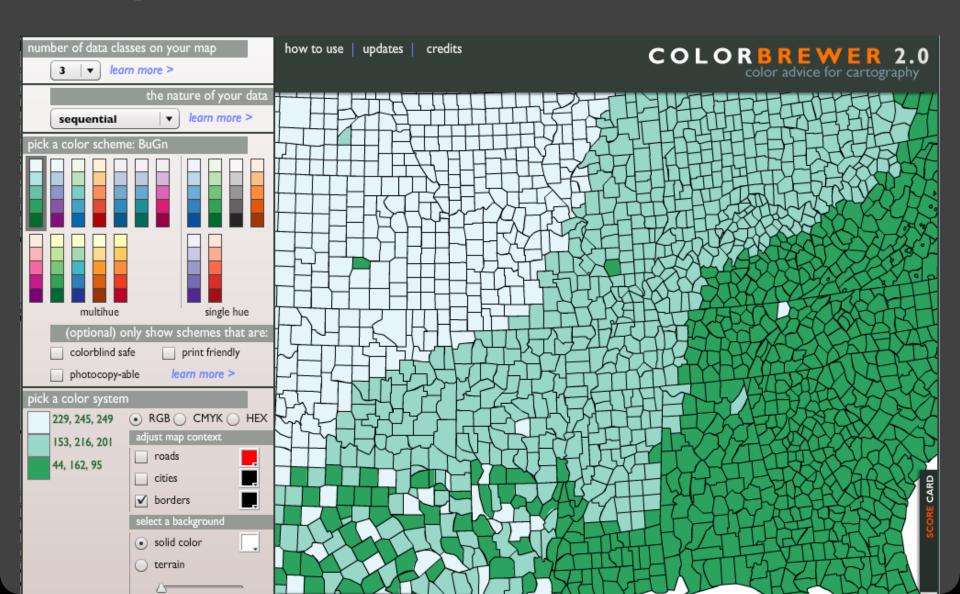

Be Wary of Naïve Rainbows!

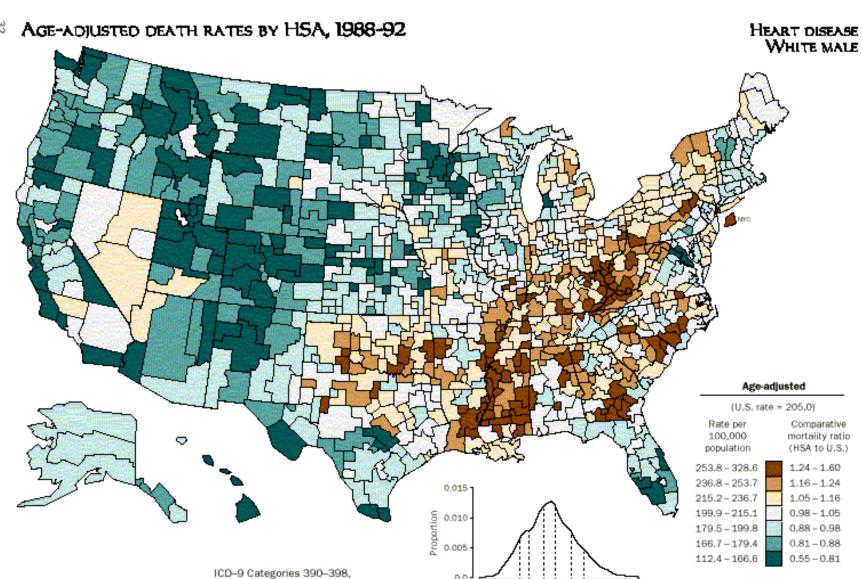

- 1. Hues are not naturally ordered
- 2. People segment colors into classes, perceptual banding
- 3. Naive rainbows are unfriendly to color blind viewers
- 4. Some colors are less effective at high spatial frequencies

Steps, rather than Gradients?

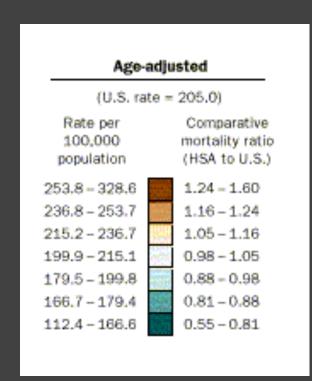

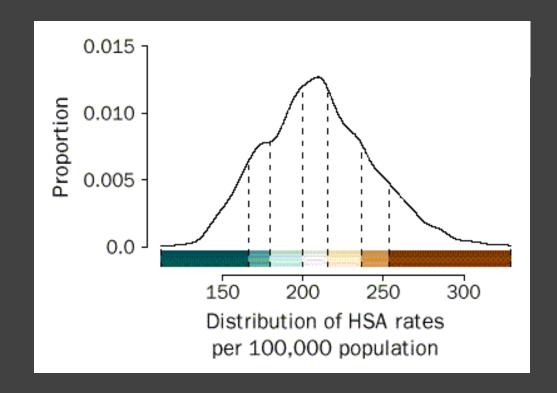

200 Distribution of HSA rates per 100,000 population

SOURCE: CDC/NCHS

402, 404-429

Classing Quantitative Data

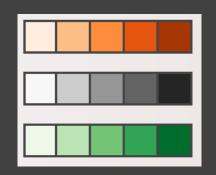

Age-adjusted mortality rates for the United States. Common option: break into 5 or 7 quantiles.

Classing Quantitative Data

- 1. Equal interval (arithmetic progression)
- 2. Quantiles (recommended)
- 3. Standard deviations
- 4. Clustering (Jenks' natural breaks / 1D K-Means)
 Minimize within group variance
 - Maximize between group variance

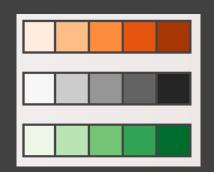

Sequential color scale

Ramp in luminance, possibly also hue Higher value -> darker color (or vice versa)

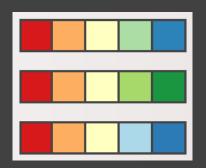

Sequential color scale

Ramp in luminance, possibly also hue
Higher value -> darker color (or vice versa)

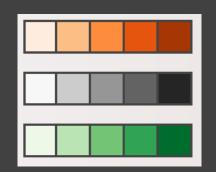

Diverging color scale

Useful when data has meaningful "midpoint" Use neutral color (e.g., grey) for midpoint Use saturated colors for endpoints

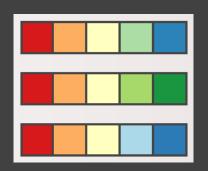

Sequential color scale

Ramp in luminance, possibly also hue Higher value -> darker color (or vice versa)

Diverging color scale

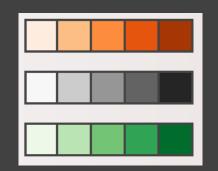

Useful when data has meaningful "midpoint" Use neutral color (e.g., grey) for midpoint Use saturated colors for endpoints

Limit number of steps in color to 3-9 *Why?*

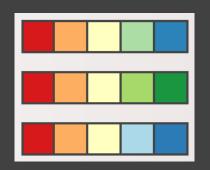

Sequential color scale

Ramp in luminance, possibly also hue Higher value -> darker color (or vice versa)

Diverging color scale

Useful when data has meaningful "midpoint" Use neutral color (e.g., grey) for midpoint Use saturated colors for endpoints

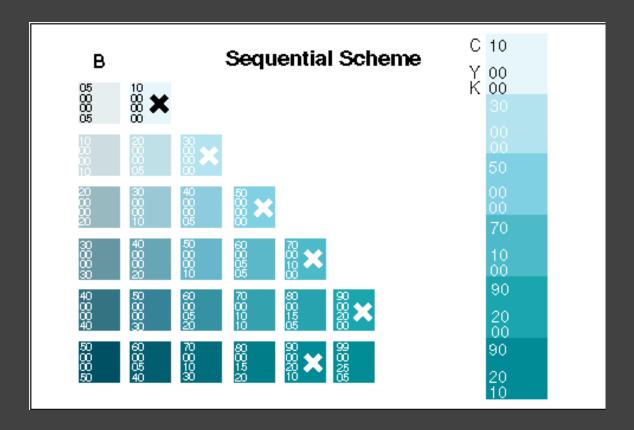

Limit number of steps in color to 3-9

Avoid simultaneous contrast, hold mappings in memory

Sequential Scales: Single-Hue

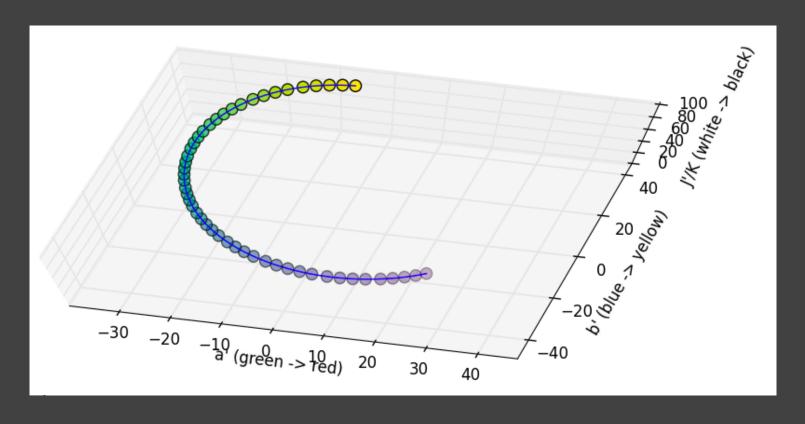

Ramp primarily in luminance, subtle hue difference

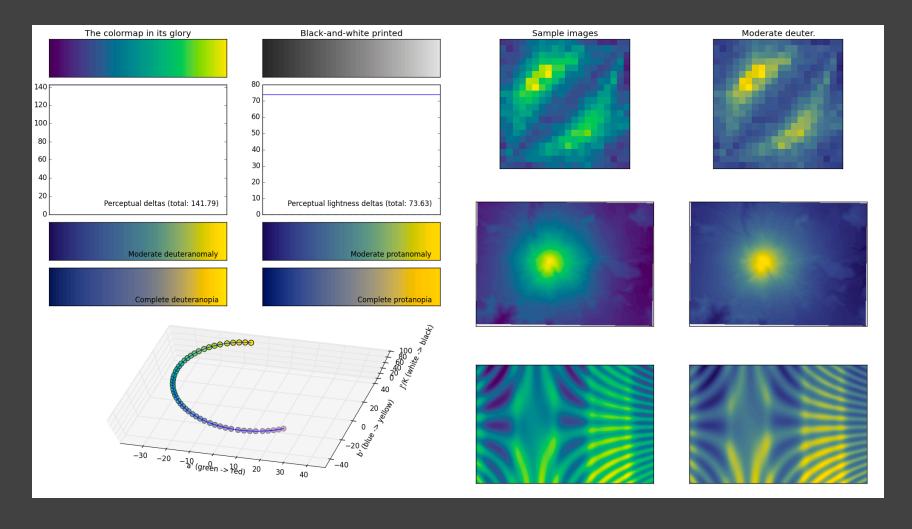

http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html

Sequential Scales: Multi-Hue

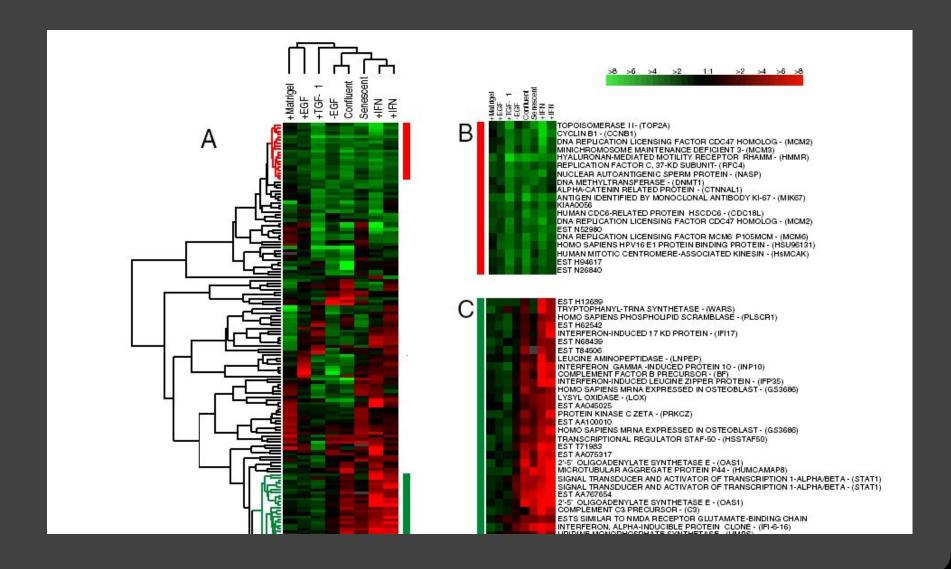

Ramp luminance & hue in perceptual color space Avoid contrasts subject to color blindness!

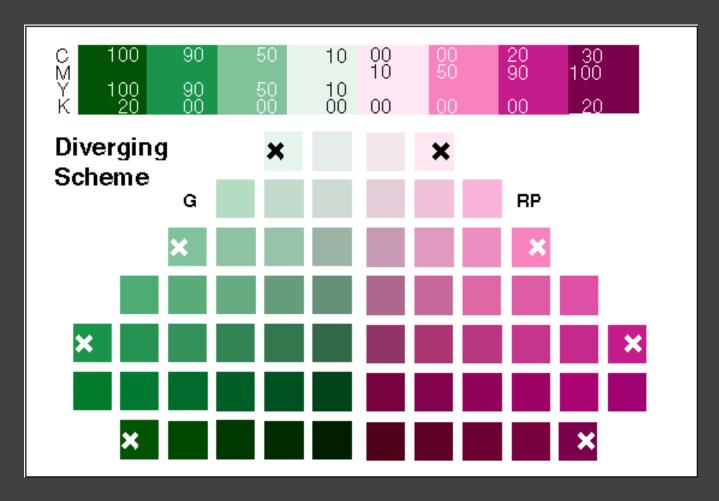

Sequential Scales: Multi-Hue

Diverging Color Scheme

Designing Diverging Scales

http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html

Designing Diverging Scales

Hue Transition

Carefully Handle Midpoint

Choose classes of values

Low, Average, High - Average should be gray

Critical Breakpoint

Defining value e.g., 0

Positive & negative should use different hues

Extremes saturated, middle desaturated

Hints for the Colorist

Use **only a few** colors (~6 ideal)

Colors should be distinctive and named

Strive for color harmony (natural colors?)

Use cultural conventions; appreciate symbolism

Get it right in black and white

Respect the color blind

Take advantage of perceptual color spaces

Color is cultural and a matter of taste!
