

Announcements

- Today: evals
- Monday: project presentations (8 min talks)

Photometric Stereo

Merle Norman Cosmetics, Los Angeles

Readings

- R. Woodham, *Photometric Method for Determining Surface Orientation from Multiple Images*. *Optical Engineering* 19(1)139-144 (1980). [PDF](#)

Diffuse reflection

$$R_e = k_d \mathbf{N} \cdot \mathbf{L} R_i$$

image intensity of P $\rightarrow I = k_d \mathbf{N} \cdot \mathbf{L}$

Simplifying assumptions

- $I = R_e$: camera response function f is the identity function:
 - can always achieve this in practice by solving for f and applying f^{-1} to each pixel in the image
- $R_i = 1$: light source intensity is 1
 - can achieve this by dividing each pixel in the image by R_i

Shape from shading

Suppose $k_d = 1$

$$\begin{aligned} I &= k_d \mathbf{N} \cdot \mathbf{L} \\ &= \mathbf{N} \cdot \mathbf{L} \\ &= \cos \theta_i \end{aligned}$$

You can directly measure angle between normal and light source

- Not quite enough information to compute surface shape
- But can be if you add some additional info, for example
 - assume a few of the normals are known (e.g., along silhouette)
 - constraints on neighboring normals—"integrability"
 - smoothness
- Hard to get it to work well in practice
 - plus, how many real objects have constant albedo?

Photometric stereo

Can write this as a matrix equation:

$$\begin{bmatrix} I_1 \\ I_2 \\ I_3 \end{bmatrix} = k_d \begin{bmatrix} \mathbf{L}_1^T \\ \mathbf{L}_2^T \\ \mathbf{L}_3^T \end{bmatrix} \mathbf{N}$$

Solving the equations

$$\underbrace{\begin{bmatrix} I_1 \\ I_2 \\ I_3 \end{bmatrix}}_{\mathbf{I}_{3 \times 1}} = \underbrace{\begin{bmatrix} \mathbf{L}_1^T \\ \mathbf{L}_2^T \\ \mathbf{L}_3^T \end{bmatrix}}_{\mathbf{L}_{3 \times 3}} \underbrace{k_d \mathbf{N}}_{\mathbf{G}_{3 \times 1}}$$

$$\mathbf{G} = \mathbf{L}^{-1} \mathbf{I}$$

$$k_d = \|\mathbf{G}\|$$

$$\mathbf{N} = \frac{1}{k_d} \mathbf{G}$$

More than three lights

Get better results by using more lights

$$\begin{bmatrix} I_1 \\ \vdots \\ I_n \end{bmatrix} = \begin{bmatrix} \mathbf{L}_1 \\ \vdots \\ \mathbf{L}_n \end{bmatrix} k_d \mathbf{N}$$

Least squares solution:

$$\begin{aligned} \mathbf{I} &= \mathbf{L} \mathbf{G} \\ \mathbf{L}^T \mathbf{I} &= \mathbf{L}^T \mathbf{L} \mathbf{G} \\ \mathbf{G} &= (\mathbf{L}^T \mathbf{L})^{-1} (\mathbf{L}^T \mathbf{I}) \end{aligned}$$

Solve for \mathbf{N} , k_d as before

What's the size of $\mathbf{L}^T \mathbf{L}$?

Computing light source directions

Trick: place a chrome sphere in the scene

- the location of the highlight tells you where the light source is

Recall the rule for specular reflection

For a perfect mirror, light is reflected about \mathbf{N}

$$R_e = \begin{cases} R_i & \text{if } \mathbf{V} = \mathbf{R} \\ 0 & \text{otherwise} \end{cases}$$

We see a highlight when $\mathbf{V} = \mathbf{R}$

- then \mathbf{L} is given as follows:

$$\mathbf{L} = 2(\mathbf{N} \cdot \mathbf{R})\mathbf{N} - \mathbf{R}$$

Depth from normals

$$\begin{aligned} \mathbf{V}_1 &= (x+1, y, z_{x+1, y}) - (x, y, z_{xy}) \\ &= (1, 0, z_{x+1, y} - z_{xy}) \end{aligned}$$

$$\begin{aligned} 0 &= \mathbf{N} \cdot \mathbf{V}_1 \\ &= (n_x, n_y, n_z) \cdot (1, 0, z_{x+1, y} - z_{xy}) \\ &= n_x + n_z(z_{x+1, y} - z_{xy}) \end{aligned}$$

Get a similar equation for \mathbf{V}_2

- Each normal gives us two linear constraints on z
- compute z values by solving a matrix equation (project 3)

Project 3

Limitations

Big problems

- doesn't work for shiny things, semi-transparent things
- shadows, inter-reflections

Smaller problems

- camera and lights have to be distant
- calibration requirements
 - measure light source directions, intensities
 - camera response function

Newer work addresses some of these issues

Some pointers for further reading:
