THE SUMMER VISION PROJECT

Seymour Papert

The summer vision project is an attempt to use our summer workers effectively in the construction of a significant part of a visual system. The particular task was chosen partly because it can be segmented into sub-problems which will allow individuals to work independently and yet participate in the construction of a system complex enough to be a real landmark in the development of "pattern recognition".

Marvin Minsky, Pioneer in Artificial Intelligence, Dies at 88

By GLENN RIFKIN JAN. 25, 2016

Marvin Minsky in a lab at M.I.T. in 1968. M.I.T.

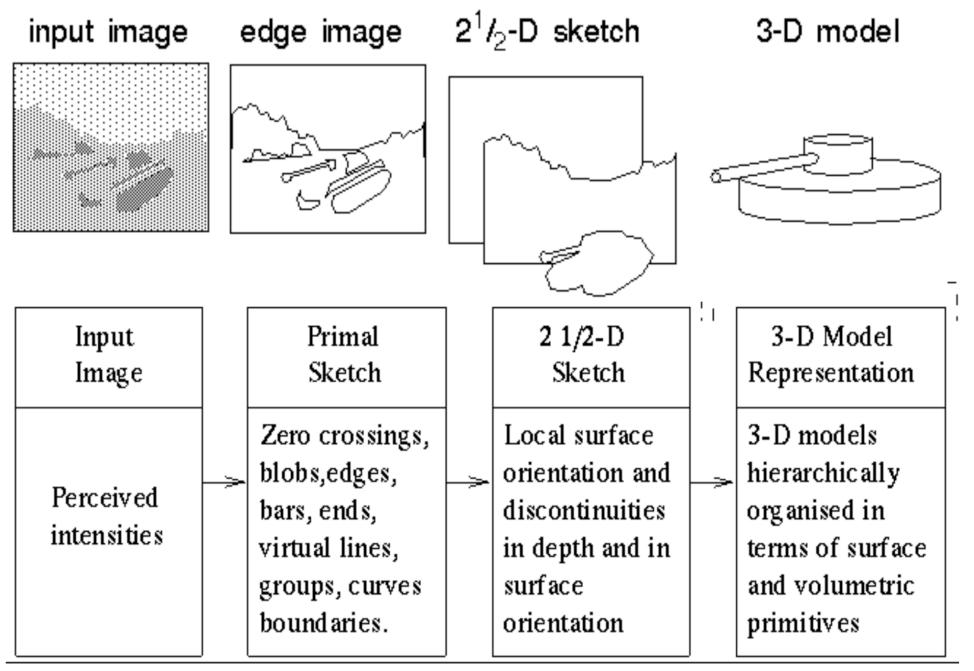

Marvin Minsky, who combined a scientist's thirst for knowledge with a philosopher's quest for truth as a pioneering explorer of artificial intelligence, work that helped inspire the creation of the personal computer and the Internet, died on Sunday night in Boston. He was 88.

His family said the cause was a cerebral hemorrhage.

Well before the advent of the microprocessor and the supercomputer, Professor Minsky, a revered computer science educator at M.I.T., laid the foundation for the field of artificial intelligence by demonstrating the possibilities of imparting common-sense reasoning to computers.

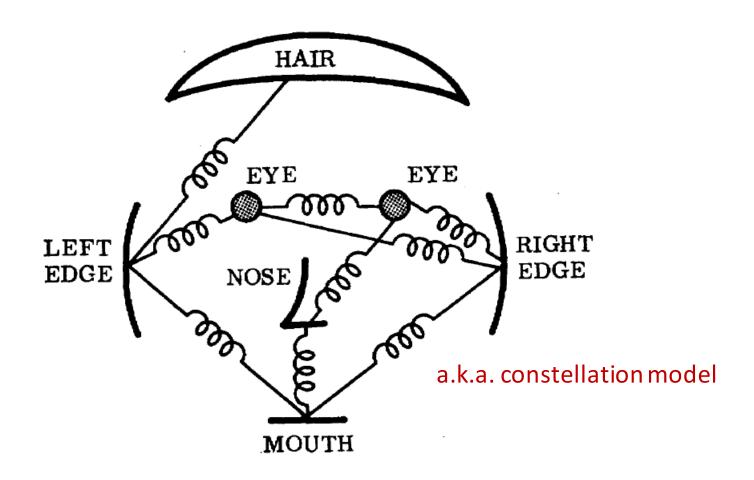

"Marvin was one of the very few people in computing whose visions and perspectives liberated the computer

Seeking a Better Way to Find Web Images

By JOHN MARKOFF NOV. 19, 2012

STANFORD, Calif. — You may think you can find almost anything on the Internet.

But even as images and video rapidly come to dominate the Web, search engines can ordinarily find a given image only if the text entered by a searcher matches the text with which it was labeled. And the labels can be unreliable, unhelpful ("fuzzy" instead of "rabbit") or simply nonexistent.

To eliminate those limits, scientists will need to create a new generation of visual search technologies — or else, as the Stanford computer scientist Fei-Fei Li recently put it, the Web will be in danger of "going dark."

Now, along with computer scientists from Princeton, Dr. Li, 36, has built the world's largest visual database in an effort to mimic the human vision system. With more than 14 million labeled objects, from obsidian to orangutans to ocelots, the database has because a vital resource for computer vision researchers.

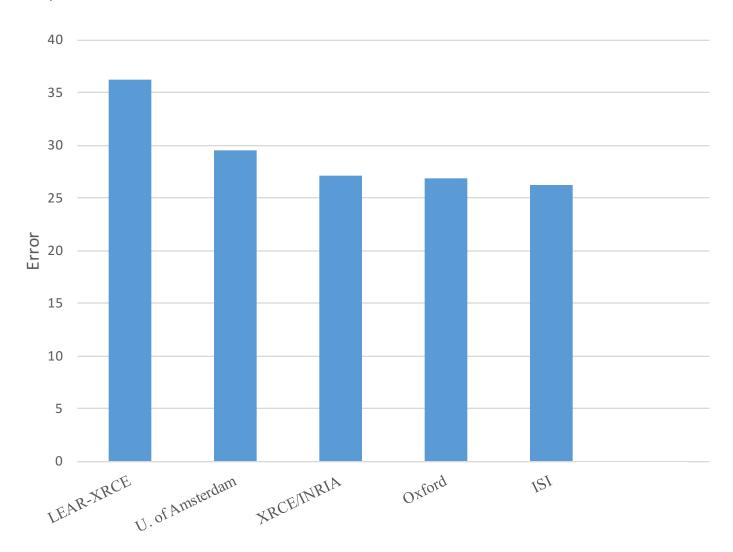

The labels were created by humans. But now machines can learn from the vast database to recognize similar, unlabeled objects, making possible a striking increase in recognition accuracy.

This summer, for example, two Google computer scientists, Andrew Y. Ng and Jeff Dean, tested the new system, known as ImageNet, on a huge collection of labeled photos.

The system performed almost twice as well as previous "neural network" algorithms — software models that seek to replicate human brain functions.

Researchers Announce Advance in Image-Recognition Software

By JOHN MARKOFF NOV. 17, 2014

MOUNTAIN VIEW, Calif. — Two groups of scientists, working independently, have created artificial intelligence software capable of recognizing and describing the content of photographs and videos with far greater accuracy than ever before, sometimes even mimicking human levels of understanding.

Until now, so-called computer vision has largely been limited to recognizing individual objects. The new software, described on Monday by researchers at Google and at Stanford University, teaches itself to identify entire scenes: a group of young men playing Frisbee, for example, or a herd of elephants marching on a grassy plain.

The software then writes a caption in English describing the picture. Compared with human observations, the researchers found, the computer-written descriptions are surprisingly accurate.

The advances may make it possible to better catalog and search for the billions of images and hours of video available online, which are often poorly described and archived. At the moment, search engines like Google rely largely on written language accompanying an image or video to ascertain what it contains.

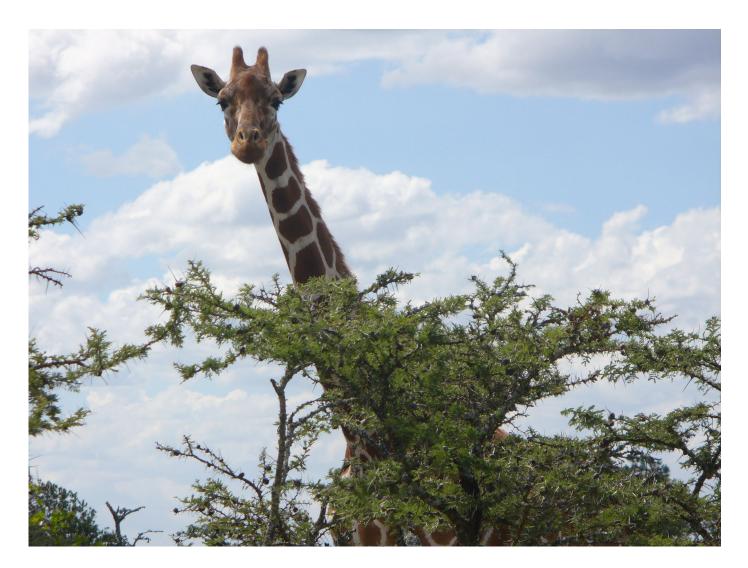

Captioned by Human and by Google's Experimental Program

Human: "A group of men playing Frisbee in the park." Computer model: "A group of young people playing a game of Frisbee."
