Streptobacillus Turing Tape Machine

Tape Machine

At each time step:

1. Read input symbol from the tape
2. Update state of the automation
3. Write a tape symbol.
4. Move the tape left or right.

Symbol	Meaning
Q	Set of tape head automation states
$\Sigma \subset \Gamma$	Set of input symbols (to the tape machine)
Γ	Set of tape symbols
$\delta : Q \times \Gamma \rightarrow Q \times \Gamma \times \{l, r\}$	State transition function
q_0	Initial state of the automation
$B \in \Gamma$	Blank tape symbol symbol
$F \subseteq \Gamma$	Final accepting states

Tape Machine

At each time step:

1. Read input symbol from the tape.
2. Update state of the automation.
3. Write a tape symbol.
4. Move the tape left or right.

Tape Machine

At each time step:

1. Read input symbol from the tape.
2. Update state of the automation.
3. Write a tape symbol.
4. Move the tape left or right.

Tape Machine

At each time step:

1. Read input symbol from the tape.
2. Update state of the automation.
3. Write a tape symbol.
4. Move the tape left or right.

The Tape is a Line of Cells

Basic idea:

Let $\Theta = \{H, H_l, H_r\}$ denote the position of the tape head (center, left, or right respectively). Define a new automaton $A' = (Q', \Sigma, \delta', q'_0, F')$ where,

$$\begin{aligned}Q' &= \Theta \times \Gamma \times Q \\ \Sigma &= (Q \times \Gamma) \cup \{\epsilon\} \\ \delta' &= Q' \times \Sigma \rightarrow Q' \times \Sigma \\ q'_0 &\in Q' \\ F' &\subseteq Q'.\end{aligned}$$

At each time step,

1. The cell holding the “tape head” state H updates its state according to the state of the tape.
2. On the state transition, the cell holding the “tape head” state broadcasts the new state of the tape head automaton and whether the tape moves left or right relative to the tape head to its immediate neighbors through a small diffusing molecule.
