

WEB PROGRAMMING

By Wyatt and Sam

BACKGROUND INFO:

- **You can write any of this code on your own computer!**
- **As long as you save a file with the extension .html, you can open it with a web browser and it will show up exactly how I've demoed it here.**

WHAT IS HTML?

- **HTML is a language for formatting documents.**
- **It's made up of elements called "tags", which are just special words enclosed in angle brackets.**
- **Tags give formatting to everything enclosed within them. For instance, the tag with the letter "p" inside means "everything here is a paragraph" and the letter "i" means "everything here is italic."**
 - **You "open" a tag by writing out the name of the tag like this: "<p>"**
 - **You "close" a tag by writing it out like this: "</p>"**
- **You can nest tags inside one another.**

<p>

This is a paragraph, and <i>this is in italics</i>
but this is not.

</p>

This is a paragraph, and *this is in italics* but this is not.

A SIMPLE PAGE

This is an example of a simple webpage written in HTML:

```
<!DOCTYPE html>
<html>
  <head>
    <title>
      Simple Webpage
    </title>
  </head>
  <body>
    <h1>This is the page header</h1>
    <p>This is the body text in the webpage.</p>
  </body>
</html>
```

A SIMPLE PAGE

This is an example of a simple webpage written in HTML:

```
<!DOCTYPE html>    This lets the browser know that our document is written in HTML.
<html>
  <head>
    <title>
      Simple Webpage
    </title>
  </head>
  <body>
    <h1>This is the page header</h1>
    <p>This is the body text in the webpage.</p>
  </body>
</html>
```

A SIMPLE PAGE

This is an example of a simple webpage written in HTML:

```
<!DOCTYPE html>    This lets the browser know that our document is written in HTML.  
<html>    This tag says "hey, I'm an HTML document!" It always opens the page.  
  <head>  
    <title>  
      Simple Webpage  
    </title>  
  </head>  
  <body>  
    <h1>This is the page header</h1>  
    <p>This is the body text in the webpage.</p>  
  </body>  
</html>
```

A SIMPLE PAGE

This is an example of a simple webpage written in HTML:

```
<!DOCTYPE html>    This lets the browser know that our document is written in HTML.  
<html>    This tag says "hey, I'm an HTML document!" It always opens the page.  
  <head>    This tag contains the page title, and sometimes other information for the browser.  
    <title>  
    Simple Webpage  
    </title>  
  </head>  
  <body>  
    <h1>This is the page header</h1>  
    <p>This is the body text in the webpage.</p>  
  </body>  
</html>
```

    </title>
  </head>
  <body>    All of the other content in your webpage is inside of the body tags.
    <h1>This is the page header</h1>    H1 is the largest size of title.
    <p>This is the body text in the webpage.</p>    P is paragraph.
  </body>
</html>
```

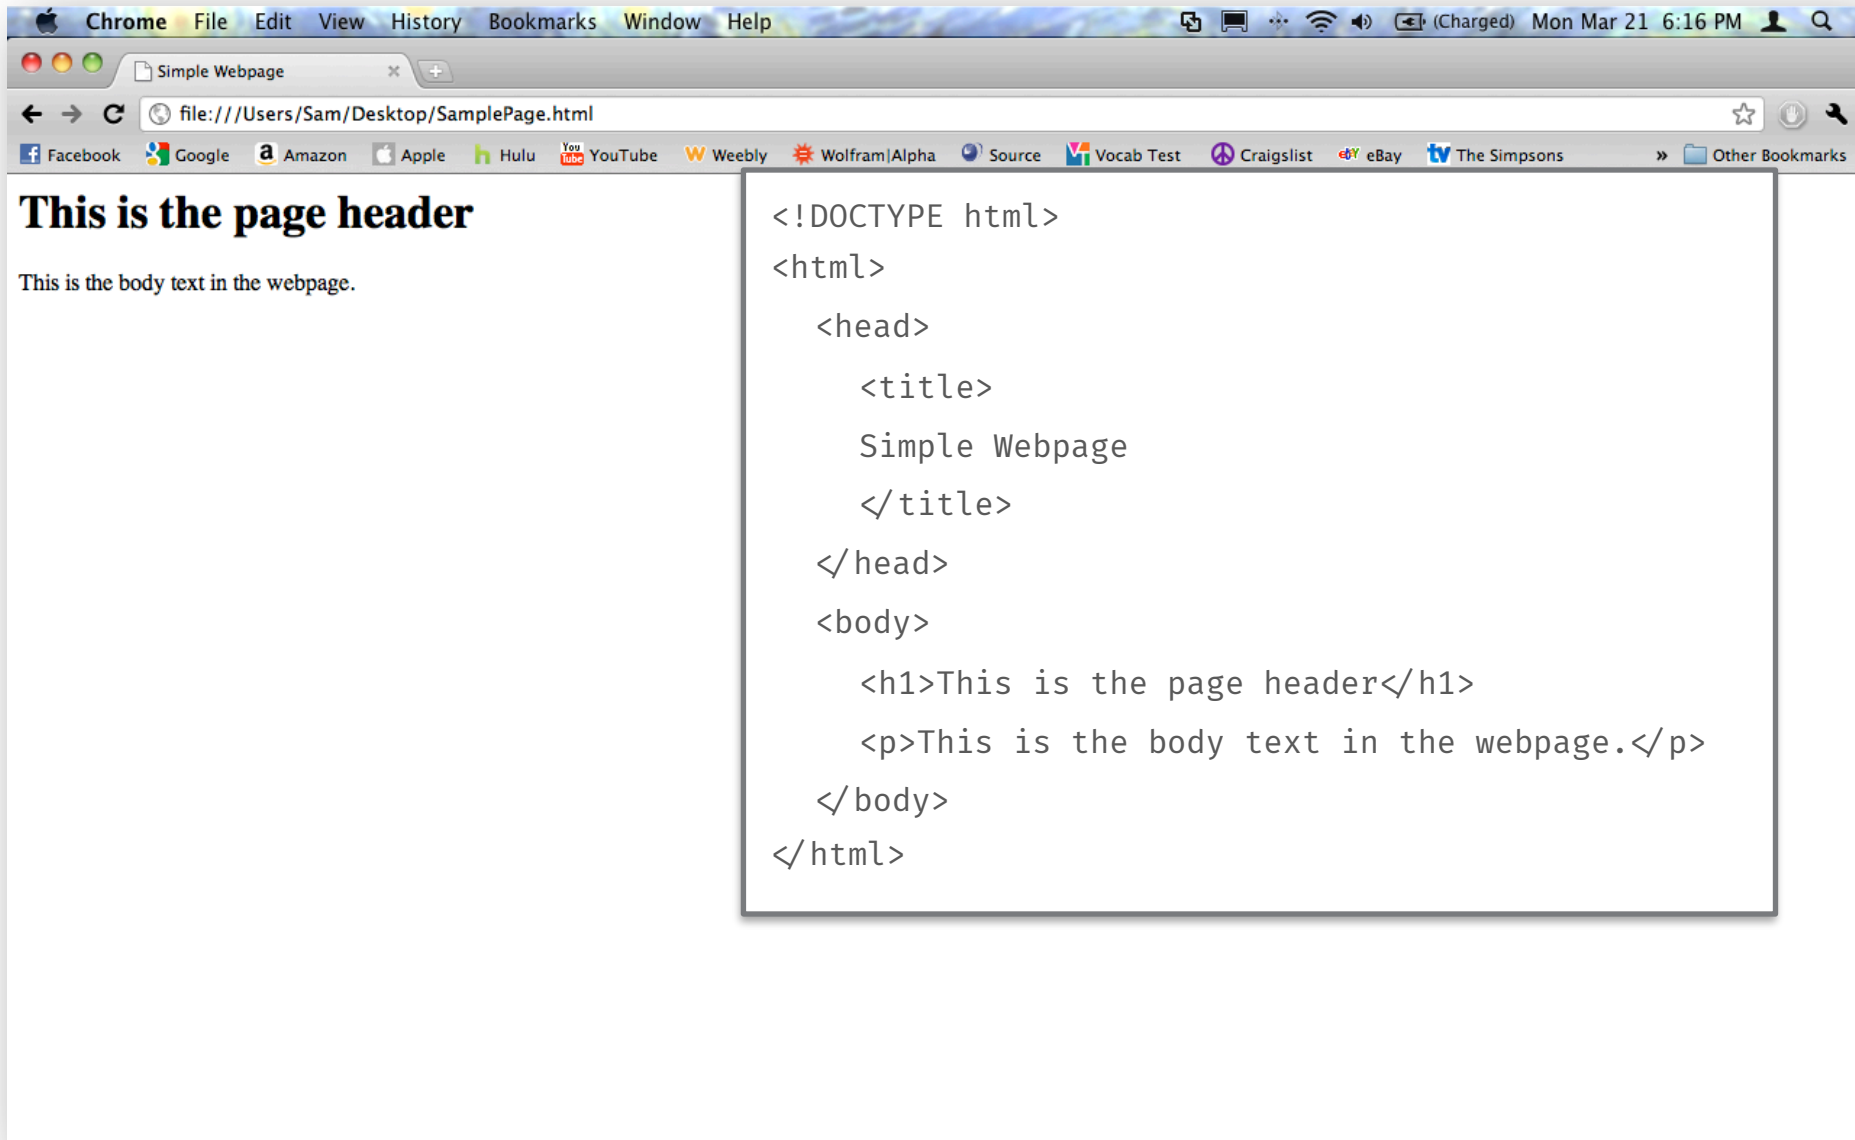

A SIMPLE PAGE

This is an example of a simple webpage written in HTML:

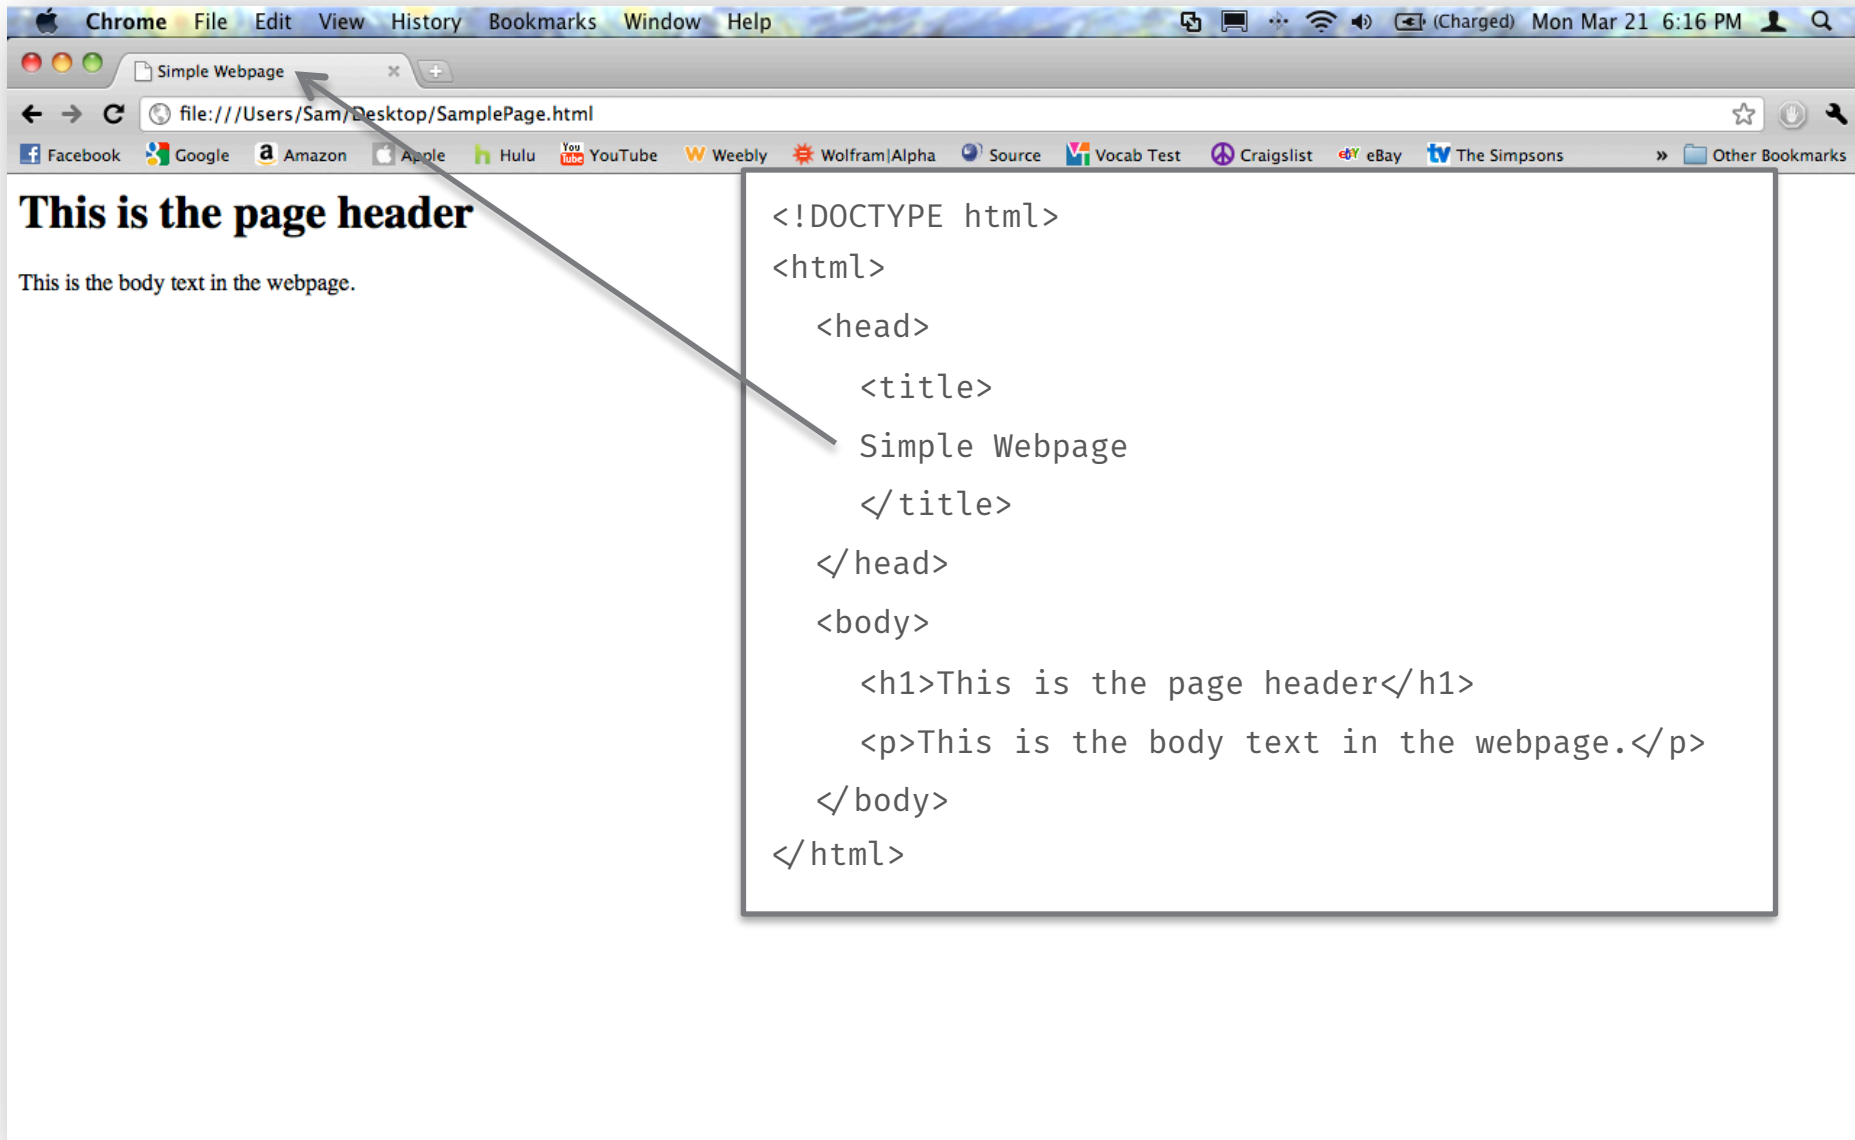

```
<!DOCTYPE html>    This lets the browser know that our document is written in HTML.
<html>    This tag says "hey, I'm an HTML document!" It always opens the page.
  <head>    This tag contains the page title, and sometimes other information for the browser.
    <title>
      Simple Webpage    The title tag determine what shows up on the tab bar in your browser.
    </title>
  </head>
  <body>    All of the other content in your webpage is inside of the body tags.
    <h1>This is the page header</h1>    H1 is the largest size of title.
    <p>This is the body text in the webpage.</p>    P is paragraph.
  </body>
</html>
```

Remember to close all your tags at the end! (HTML is actually pretty forgiving if you forget, but it's good style to do so).

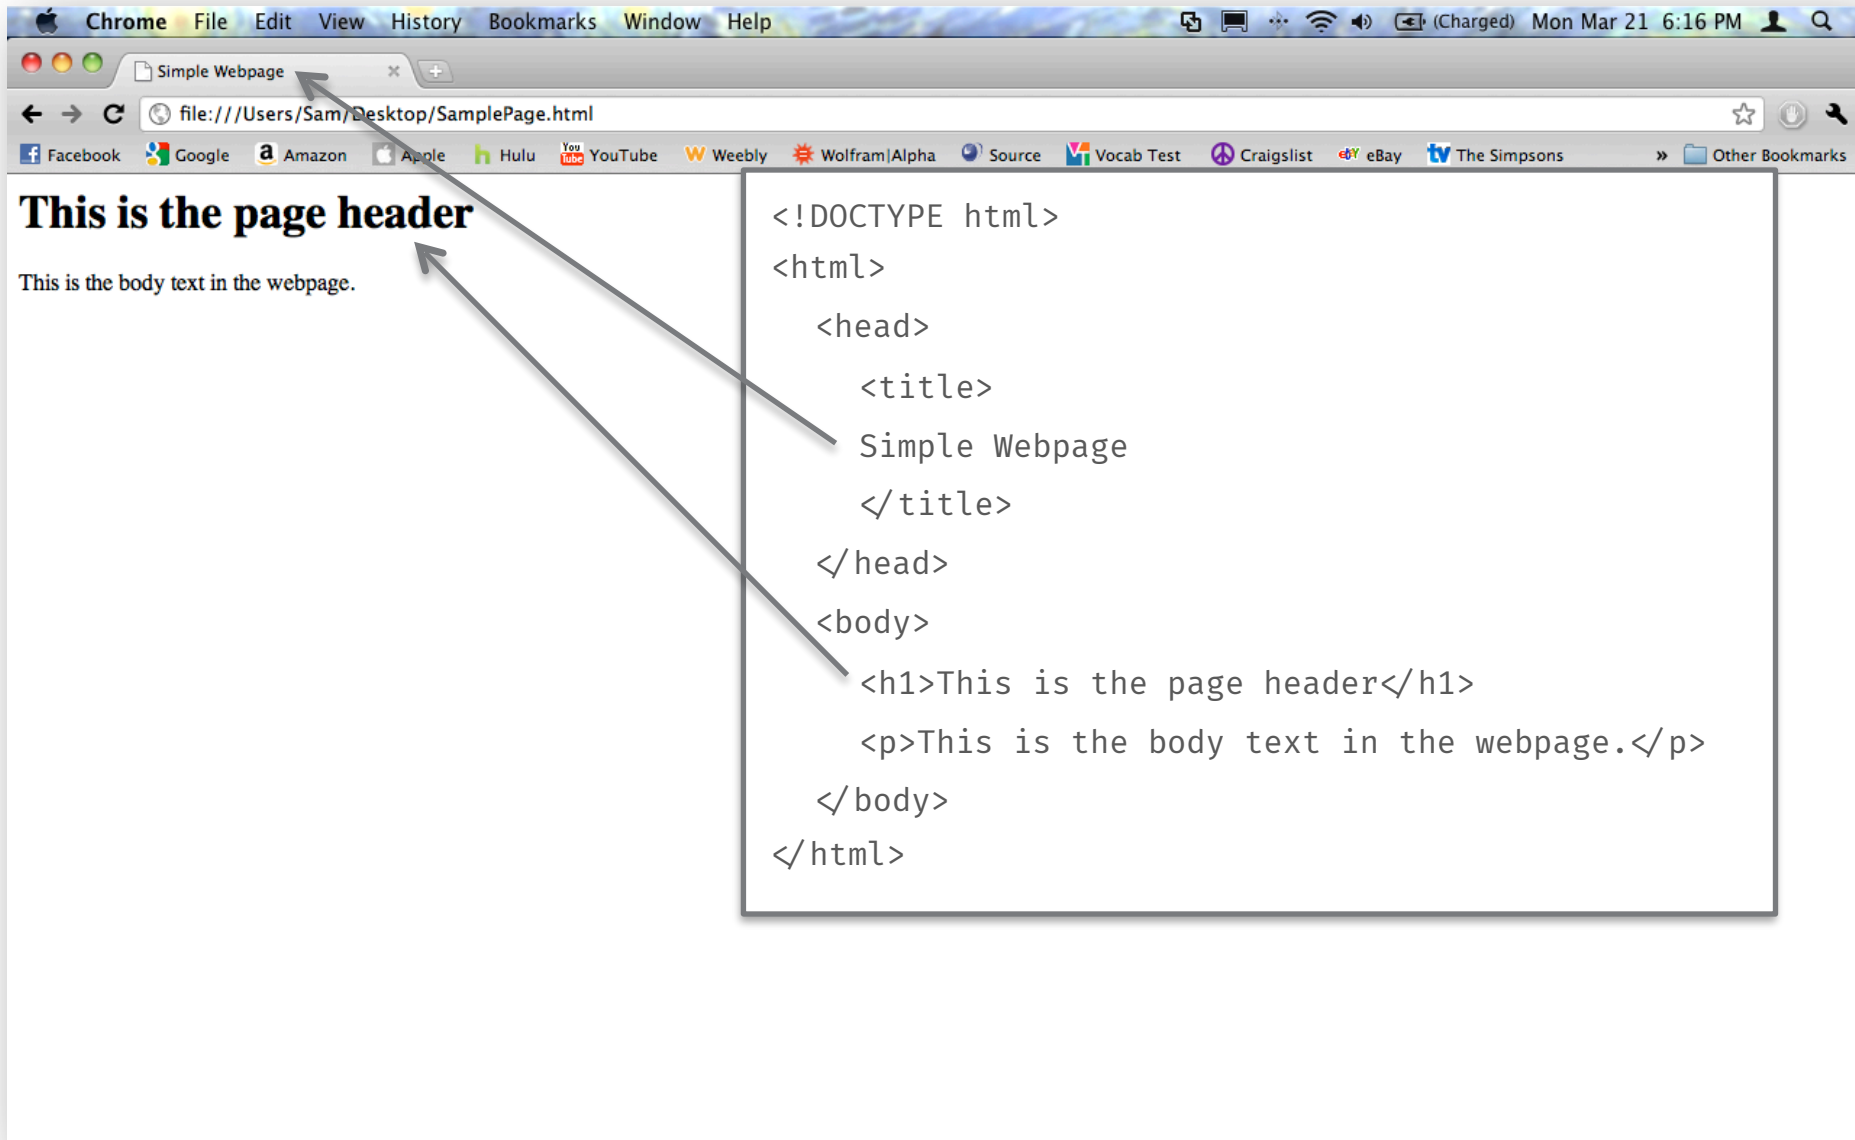

This page shows up like this in a browser :

This page shows up like this in a browser :

This page shows up like this in a browser :

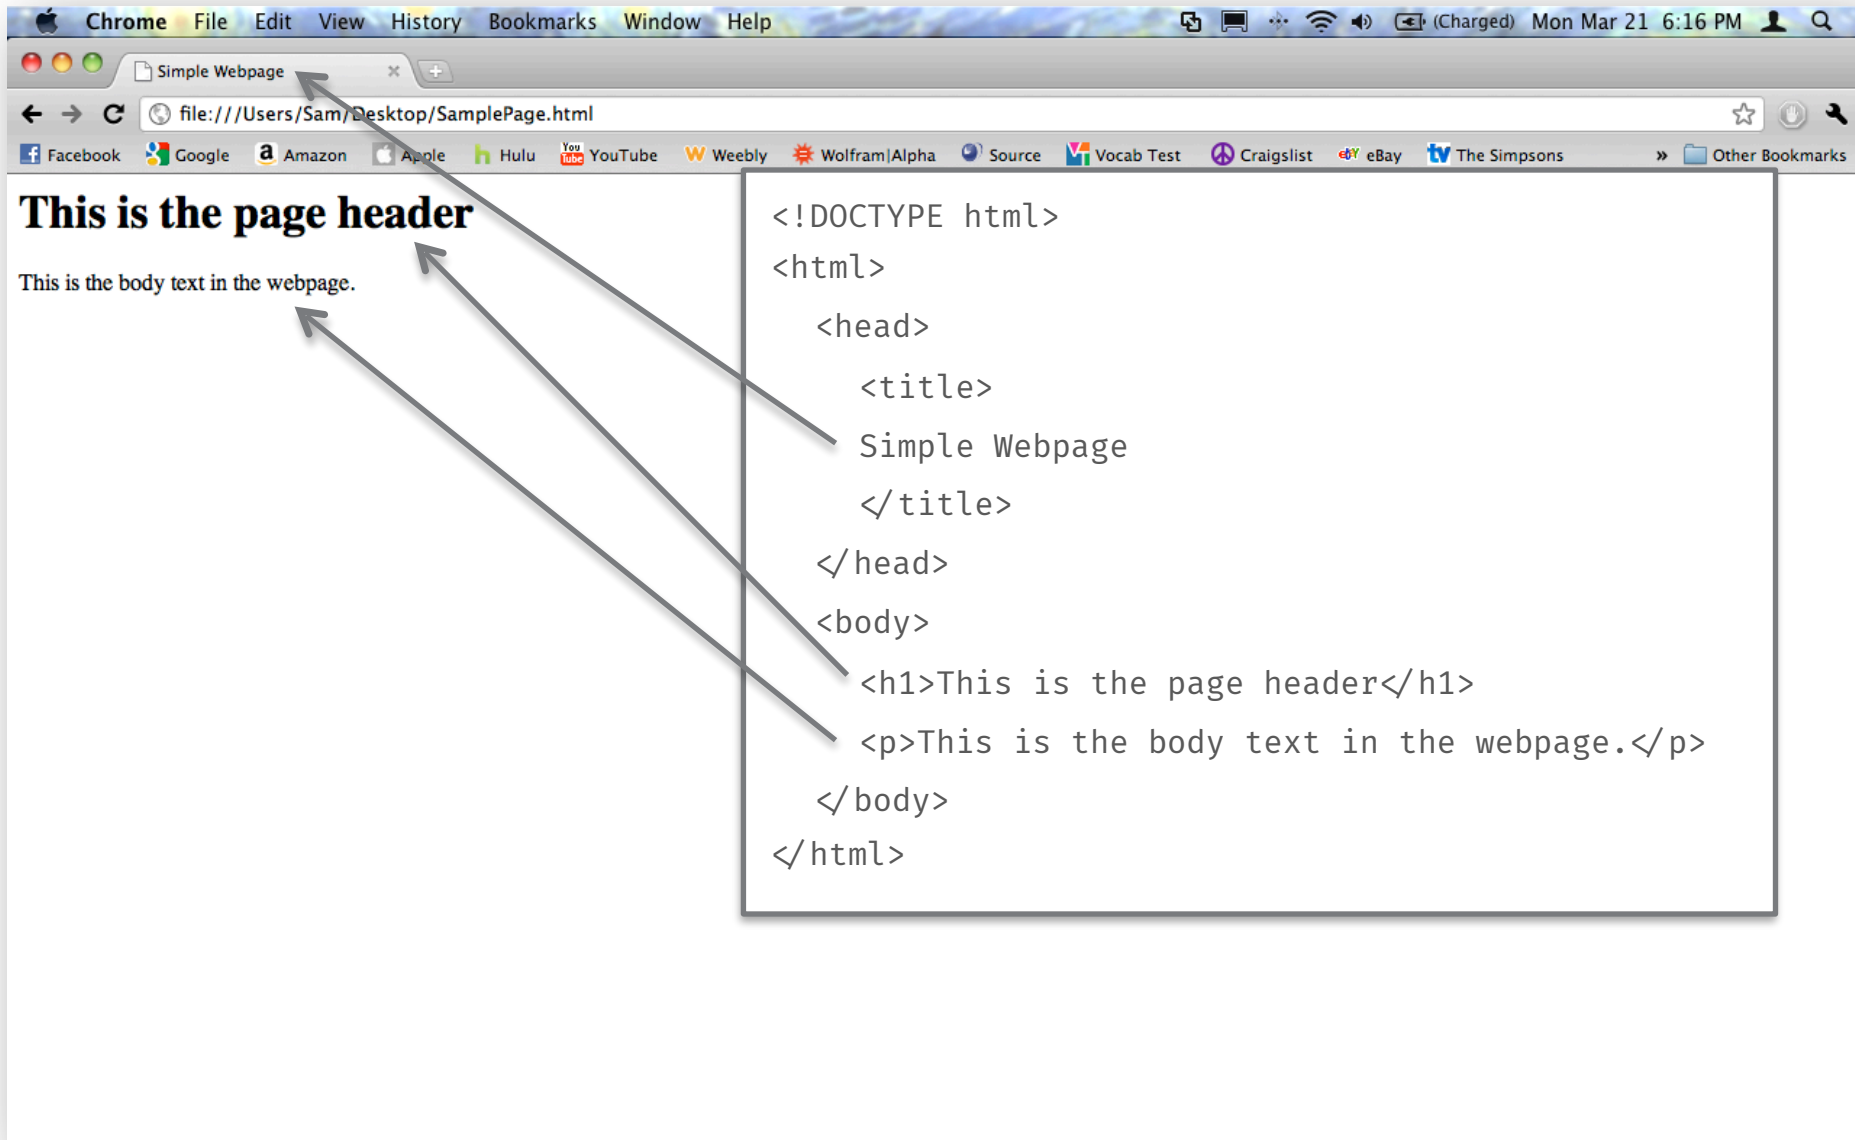

The screenshot shows a Chrome browser window displaying a file named "Simple Webpage" at the path "file:///Users/Sam/Desktop/SamplePage.html". The browser's address bar and menu bar are visible. The webpage content consists of a large heading and a paragraph of text. To the right of the browser window, a white box contains the HTML source code for the page. Three arrows originate from the code box: one points to the browser's title bar, another points to the heading, and the third points to the paragraph of text.

This is the page header

This is the body text in the webpage.

```
<!DOCTYPE html>
<html>
  <head>
    <title>
      Simple Webpage
    </title>
  </head>
  <body>
    <h1>This is the page header</h1>
    <p>This is the body text in the webpage.</p>
  </body>
</html>
```

This page shows up like this in a browser :

The screenshot shows a Chrome browser window displaying a file named "Simple Webpage" at the path "file:///Users/Sam/Desktop/SamplePage.html". The browser's address bar and menu bar are visible. The webpage content consists of a large bold heading "This is the page header" and a paragraph "This is the body text in the webpage." below it. To the right, a white box contains the HTML source code for the page. Arrows point from the code to the corresponding elements in the browser: from the title tag to the page title, from the h1 tag to the heading, and from the p tag to the body text.

```
<!DOCTYPE html>
<html>
  <head>
    <title>
      Simple Webpage
    </title>
  </head>
  <body>
    <h1>This is the page header</h1>
    <p>This is the body text in the webpage.</p>
  </body>
</html>
```

COLORS

- **To change the color of something, you can customize certain "attributes" of HTML tags. This is additional information that you type into the opening tag.**
- **You set the color of an element (as well as other styles) using the style attribute.**
- **For example, to create blue text:**

```
<p style="color: blue;">This is blue text</p>
```

And that shows up like this:

This is blue text

EMBEDDING STUFF

Let's say that you want to embed a picture in your website. What do you do?

It's actually very simple. It only requires very little code, and you don't even need a closing tag!

Simply type this code:

```

```

EMBEDDING STUFF

**Let's say that you want to embed a picture in your website. What do you do?
It's actually very simple. It only requires very little code, and you don't even need a closing tag!**

Simply type this code:

```

```

**Image tag
and source
attribute**

EMBEDDING STUFF

←
This file must be a picture file-
.jpg, .gif, etc. Not .htm, .html, etc.

To define the height and width of an image, we'll use `style` again!

```

```

"px" is a unit of measurement
that computers use. 1 px = 1 pixel
on your screen.

CHANGING FONTS 😊

CHANGING FONTS 😊

style **to the rescue** again!

CHANGING FONTS 😊

style **to the rescue again!**

To change font, add font-family to your style attribute:

CHANGING FONTS 😊

style **to the rescue again!**

To change font, add font-family to your style attribute:

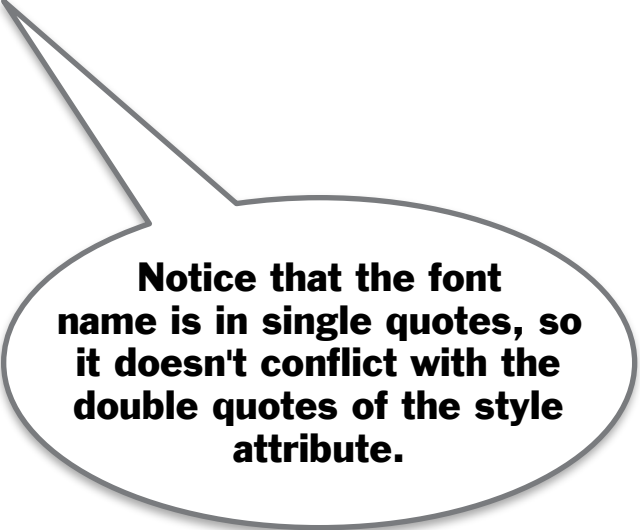

```
<p style="font-family: 'Arial';">Text in Arial</p>
```

CHANGING FONTS 😊

style **to the rescue again!**

To change font, add font-family to your style attribute:

```
<p style="font-family: 'Arial';">Text in Arial</p>
```

Notice that the font name is in single quotes, so it doesn't conflict with the double quotes of the style attribute.

MORE ON STYLE

You can combine style attributes to create tags styled however you want!

Suppose you want a centered paragraph, with blue text, 24 pixels tall, and in Comic Sans:

```
<p style="font-family: 'Comic Sans MS'; text-align: center; color: blue; font-size: 24px;">Look at me!</p>
```

MORE ON STYLE

You can combine style attributes to create tags styled however you want!

Suppose you want a centered paragraph, with blue text, 24 pixels tall, and in Comic Sans:

```
<p style="font-family: 'Comic Sans MS'; text-align: center; color: blue; font-size: 24px;">Look at me!</p>
```

AN INFINITE ASSORTMENT OF TAGS

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

`Link to Google!` - **This tag creates a link to another page (or another website!)**

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

`Link to Google!` - **This tag creates a link to another page (or another website!)**

`<h1>`, `<h2>`, `<h3>`, **etc.** – **These tags define the header on the web page. The higher the number, the smaller the font size.**

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

`Link to Google!` - **This tag creates a link to another page (or another website!)**

`<h1>`, `<h2>`, `<h3>`, **etc.** – **These tags define the header on the web page. The higher the number, the smaller the font size.**

`<p>` - **This tag defines a paragraph, which makes up the majority of the text on the webpage.**

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

`Link to Google!` - **This tag creates a link to another page (or another website!)**

`<h1>`, `<h2>`, `<h3>`, **etc.** – **These tags define the header on the web page. The higher the number, the smaller the font size.**

`<p>` - **This tag defines a paragraph, which makes up the majority of the text on the webpage.**

`Some inline text` - **This is like the `<p>` tag, except it doesn't create a new line when you use it. It's good for when you want to style certain parts of a paragraph in a specific way without affecting the entire paragraph.**

AN INFINITE ASSORTMENT OF TAGS

Included in HTML are a myriad of different tags. Some examples are:

`Link to Google!` - **This tag creates a link to another page (or another website!)**

`<h1>`, `<h2>`, `<h3>`, **etc.** – **These tags define the header on the web page. The higher the number, the smaller the font size.**
