- **Warm Up** ◀
- More Instance Methods
- Encapsulation
- Constructors

Practice : Think

sli.do

#cse122

What do `p` and `p2` hold after the following code is executed?

```
Point p = new Point();  
p.x = 3;  
p.y = 10;  
Point p2 = p;  
p2.y = 100;  
p = new Point();  
p.y = -99;
```

- A. `p: (3, 10)` `p2: (3, 10)`
- B. `p: (3, -99)` `p2: (3, 100)`
- C. `p: (0, -99)` `p2: (3, 100)`
- D. `p: (3, -99)` `p2: (0, 100)`
- E. `p: (0, -99)` `p2: (3, 10)`

Practice : Pair

sli.do #cse122

What do p and p2 hold after the following code is executed?

```
➔ Point p = new Point();  
➔ p.x = 3;  
➔ p.y = 10;  
➔ Point p2 = p;  
➔ p2.y = 100;  
➔ p = new Point();  
➔ p.y = -99;
```

p: 0, -99

- A. p: (3, 10) p2: (3, 10)
- B. p: (3, -99) p2: (3, 100)
- C. p: (0, -99) p2: (3, 100)
- D. p: (3, -99) p2: (0, 100)
- E. p: (0, -99) p2: (3, 10)

p2: old p i.e. (3, 100)

Client v. Implementor

We have been the clients of many objects this quarter!

Now we will become the implementors of our own objects!

Practice : Think

[sli.do](#)

#cse122

What is the correct implementation of the `distanceFrom` instance method?

$$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

(A)

```
public double distanceFrom() {  
    double xTerm = Math.pow(x - x, 2);  
    double yTerm = Math.pow(y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(B)

```
public static double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(C)

```
public double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(D)

```
public double distanceFrom(int otherX, int otherY) {  
    double xTerm = Math.pow(otherX - x, 2);  
    double yTerm = Math.pow(otherY - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

Practice : Pair

[sli.do](#) [#cse122](#)

What is the correct implementation of the `distanceFrom` instance method?

$$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

(A)

```
public double distanceFrom() {
    double xTerm = Math.pow(x - x, 2);
    double yTerm = Math.pow(y - y, 2);
    return Math.sqrt(xTerm + yTerm);
}
```

(B)

```
public static double distanceFrom(Point otherPoint) {
    double xTerm = Math.pow(otherPoint.x - x, 2);
    double yTerm = Math.pow(otherPoint.y - y, 2);
    return Math.sqrt(xTerm + yTerm);
}
```

(C)

```
public double distanceFrom(Point otherPoint) {
    double xTerm = Math.pow(otherPoint.x - x, 2);
    double yTerm = Math.pow(otherPoint.y - y, 2);
    return Math.sqrt(xTerm + yTerm);
}
```

(D)

```
public double distanceFrom(int otherX, int otherY) {
    double xTerm = Math.pow(otherX - x, 2);
    double yTerm = Math.pow(otherY - y, 2);
    return Math.sqrt(xTerm + yTerm);
}
```

toString

```
public String toString() {  
    return "String representation of object";  
}
```

The `toString()` method is automatically called whenever an object is treated like a `String`!

toString

```
public String toString() {  
    return "String representation of object";  
}
```

The `toString()` method is automatically called whenever an object is treated like a `String`!

Wait: Why not write a `print()` method that prints out the `String` representation to the console? All `toString()` does is return a `String`!

Lecture Outline

- Announcements
- Warm Up
- More Instance Methods
- **Encapsulation** ◀
- Constructors

Encapsulation

Objects **encapsulate** state and expose behavior.

Encapsulation is hiding implementation details of an object from its clients. (Clients = chaos, y'all.)

Encapsulation provides *abstraction*.

private

The `private` keyword is an **access modifier** (like `public`)

Fields declared `private` cannot be accessed by any code outside of the object.

We always want to encapsulate our objects' fields by declaring them `private`.

Accessors and Mutators

Declaring fields as private removes all access from the user.

If we want to give some back, we can define instance methods.

Accessors (“getters”)	Mutators (“setters”)
<code>getX()</code>	<code>setX(int newX)</code>
<code>getY()</code>	<code>setY(int newY)</code>
	<code>setLocation(int newX, int newY)</code>

Encapsulation

Objects **encapsulate** state and expose behavior.

Encapsulation is hiding implementation details of an object from its clients.

Encapsulation provides *abstraction*.

Encapsulation also gives the implementor flexibility!

Encapsulation

While users can still access and modify our Point's fields with the instance methods we defined, *we have control of how they do so.*

Can only accept positive coordinate values

Can swap out our underlying implementation to use polar coordinates instead!

Lecture Outline

- Warm Up
- More Instance Methods
- Encapsulation
- **Constructors** 

Constructors

Constructors are called when we first create a new instance of a class.

```
Point p = new Point();
```

If we don't write any constructors, Java provides one that takes no parameters and just sets each field to its default value.

Constructor Syntax

```
public Point(int initialX, int initialY) {  
    x = initialX;  
    y = initialY;  
}
```

this keyword

The `this` keyword refers to the current object in a method or constructor.

You can use it to refer to an object's fields

```
this.x, this.y
```

You can use it to refer to an object's instance methods

```
this.setX(newX)
```

Constructor Syntax

```
public Point(int initialX, int initialY) {  
    x = initialX;  
    y = initialY;  
}
```

If we write any constructors, Java no longer provides one for us.

this keyword

The `this` keyword refers to the current object in a method or constructor.

You can use it to refer to an object's fields

```
this.x, this.y
```

You can use it to refer to an object's instance methods

```
this.setX(newX)
```

You can use it to call one constructor from another

```
this(0, 0)
```
