Lecture Outline

- **Announcements** 
- Warm Up
- More Instance Methods
- Encapsulation
- Constructors

Announcements

- Creative Project 2 will be released later today!
 - Focused on OOP
 - You have a week and a half— `.peek()` at it early!
- Resubmission Cycle 4 (R4) out soon!
 - C1, P1, P2 eligible for resub
- Quiz 1 was yesterday; grades will be released just before Quiz 2!

Lecture Outline

- Announcements
- Warm Up 
- More Instance Methods
- Encapsulation
- Constructors

Practice : Think

[sli.do](#)[#cse122](#)

What do `p` and `p2` hold after the following code is executed?

```
Point p = new Point();  
p.x = 3;  
p.y = 10;  
Point p2 = p;  
p2.y = 100;  
p = new Point();  
p.y = -99;
```

- A. `p: (3, 10)` `p2: (3, 10)`
- B. `p: (3, -99)` `p2: (3, 100)`
- C. `p: (0, -99)` `p2: (3, 100)`
- D. `p: (3, -99)` `p2: (0, 100)`
- E. `p: (0, -99)` `p2: (3, 10)`

Practice : Pair

sli.do

#cse122

What do p and p2 hold after the following code is executed?

```
➡ Point p = new Point();  
➡ p.x = 3;  
➡ p.y = 10;  
➡ Point p2 = p;  
➡ p2.y = 100;  
➡ p = new Point();  
➡ p.y = -99;
```

- A. p: (3, 10) p2: (3, 10)
- B. p: (3, -99) p2: (3, 100)
- C. p: (0, -99) p2: (3, 100)
- D. p: (3, -99) p2: (0, 100)
- E. p: (0, -99) p2: (3, 10)

p: 0, -99

p2: old p i.e. (3, 100)

Abstraction

The separation of ideas from details, meaning that we can use something without knowing exactly how it works.

You were able use the Scanner class without understanding how it works internally!

Client v. Implementor

We have been the clients of many objects this quarter!

Now we will become the implementors of our own objects!

Practice : Think

sli.do

#cse122

What is the correct implementation of the `distanceFrom` instance method?

$$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

(A)

```
public double distanceFrom() {  
    double xTerm = Math.pow(x - x, 2);  
    double yTerm = Math.pow(y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(B)

```
public static double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(C)

```
public double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(D)

```
public double distanceFrom(int otherX, int otherY) {  
    double xTerm = Math.pow(otherX - x, 2);  
    double yTerm = Math.pow(otherY - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

Practice : Pair

What is the correct implementation of the distanceFrom instance method?

$$\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

(A)

```
public double distanceFrom() {  
    double xTerm = Math.pow(x - x, 2);  
    double yTerm = Math.pow(y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(B)

```
public static double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(C)

```
public double distanceFrom(Point otherPoint) {  
    double xTerm = Math.pow(otherPoint.x - x, 2);  
    double yTerm = Math.pow(otherPoint.y - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

(D)

```
public double distanceFrom(int otherX, int otherY) {  
    double xTerm = Math.pow(otherX - x, 2);  
    double yTerm = Math.pow(otherY - y, 2);  
    return Math.sqrt(xTerm + yTerm);  
}
```

toString

```
public String toString() {  
    return "String representation of object";  
}
```

The `toString()` method is automatically called whenever an object is treated like a `String`!

toString

```
public String toString() {  
    return "String representation of object";  
}
```

The `toString()` method is automatically called whenever an object is treated like a `String`!

Wait: Why not write a `print()` method that prints out the `String` representation to the console? All `toString()` does is return a `String`!

Lecture Outline

- Announcements
- Warm Up
- More Instance Methods
- **Encapsulation** 
- Constructors

Encapsulation

Objects **encapsulate** state and expose behavior.

Encapsulation is hiding implementation details of an object from its clients. (Clients = chaos, y'all.)

Encapsulation provides *abstraction*.

private

The **private** keyword is an **access modifier** (like **public**)

Fields declared **private** cannot be accessed by any code outside of the class.

We always want to encapsulate our objects' fields by declaring them **private**.

Accessors and Mutators

Declaring fields as private removes all access from the user.

If we want to give some back, we can define instance methods.

Accessors (“getters”)	Mutators (“setters”)
<code>getX()</code>	<code>setX(int newX)</code>
<code>getY()</code>	<code>setY(int newY)</code>
	<code>setLocation(int newX, int newY)</code>

Encapsulation

Objects **encapsulate** state and expose behavior.

Encapsulation is hiding implementation details of an object from its clients.

Encapsulation provides *abstraction*.

Encapsulation also gives the implementor flexibility!

Encapsulation

While users can still access and modify our Point's fields with the instance methods we defined, *we have control of how they do so.*

Example: Can only accept positive coordinate values

Another Example: Can swap out our underlying implementation to use polar coordinates instead!

Lecture Outline

- Warm Up
- More Instance Methods
- Encapsulation
- **Constructors** 

Constructors

Constructors are called when we first create a new instance of a class.

```
Point p = new Point();
```

If we don't write any constructors, Java provides one that takes no parameters and just sets each field to its default value.

Constructor Syntax

```
public Point(int initialX, int initialY) {  
    x = initialX;  
    y = initialY;  
}
```

this keyword

The `this` keyword refers to the current object in a method or constructor.

You can use it to refer to an object's fields

`this.x, this.y`

You can use it to refer to an object's instance methods

`this.setX(newX)`

Constructor Syntax

```
public Point(int initialX, int initialY) {  
    x = initialX;  
    y = initialY;  
}
```

If we write any constructors, Java no longer provides one for us.

this keyword

The `this` keyword refers to the current object in a method or constructor.

You can use it to refer to an object's fields

```
this.x, this.y
```

You can use it to refer to an object's instance methods

```
this.setX(newX)
```

You can use it to call one constructor from another

```
this(0, 0)
```
